

Washington State Institute for Public Policy Meta-Analytic Results

Wilderness adventure therapy for court-involved youth Juvenile Justice

Literature review updated December 2021.

As part of WSIPP's research approach to identifying evidence-based programs and policies, WSIPP determines "what works" (and what does not work) to improve outcomes using an approach called meta-analysis. For detail on our methods, see our Technical Documentation. At this time, WSIPP has not yet calculated benefits and costs for this topic.

Program Description: No rigorous evaluations measuring outcome of interest.

Meta-Analysis of Program Effects									
No. of effect	Treatment N	Adjusted effect sizes and standard errors used in the benefit- cost analysis					(random effects		
sizes		First time ES is estimated			Second time ES is estimated			model)	
		ES	SE	Age	ES	SE	Age	ES	p-value
	No. of	No. of Treatment effect N	No. of effect sizes Treatment Adjusted effect N First time	No. of effect sizes No. of effect sizes No. of effect sizes First time ES is estima	No. of effect sizes and stand cost at Sizes Sizes Sizes First time ES is estimated	No. of effect sizes and standard errors used to size and siz	No. of effect sizes and standard errors used in the become cost analysis First time ES is estimated Second time ES is estimated	No. of effect sizes No. of effect sizes No. of effect Sizes and standard errors used in the benefit-cost analysis First time ES is estimated Second time ES is estimated	No. of effect sizes and standard errors used in the benefit-cost analysis No. of effect sizes and standard errors used in the benefit-(randor mode) First time ES is estimated Second time ES is estimated

Meta-analysis is a statistical method to combine the results from separate studies on a program, policy, or topic in order to estimate its effect on an outcome. WSIPP systematically evaluates all credible evaluations we can locate on each topic. The outcomes measured are the types of program impacts that were measured in the research literature (for example, crime or educational attainment). Treatment N represents the total number of individuals or units in the treatment group across the included studies.

An effect size (ES) is a standard metric that summarizes the degree to which a program or policy affects a measured outcome. If the effect size is positive, the outcome increases. If the effect size is negative, the outcome decreases.

Adjusted effect sizes are used to calculate the benefits from our benefit cost model. WSIPP may adjust effect sizes based on methodological characteristics of the study. For example, we may adjust effect sizes when a study has a weak research design or when the program developer is involved in the research. The magnitude of these adjustments varies depending on the topic area.

WSIPP may also adjust the second ES measurement. Research shows the magnitude of some effect sizes decrease over time. For those effect sizes, we estimate outcome-based adjustments which we apply between the first time ES is estimated and the second time ES is estimated. We also report the unadjusted effect size to show the effect sizes before any adjustments have been made. More details about these adjustments can be found in our Technical Documentation.

Washington State Institute for Public Policy

The Washington State Legislature created the Washington State Insititute for Public Policy in 1983. A Board of Directors-representing the legislature, the governor, and public universities-governs WSIPP and guides the development of all activities. WSIPP's mission is to carry out practical research, at legislative direction, on issues of importance to Washington State.
