

The WSIPP benefit-cost analysis examines, on an apples-to-apples basis, the monetary value of programs or policies to determine whether the benefits from the program exceed its costs. WSIPP's research approach to identifying evidence-based programs and policies has three main steps. First, we determine "what works" (and what does not work) to improve outcomes using a statistical technique called meta-analysis. Second, we calculate whether the benefits of a program exceed its costs. Third, we estimate the risk of investing in a program by testing the sensitivity of our results. For more detail on our methods, see our [Technical Documentation](#).

Current estimates replace old estimates. Numbers will change over time as a result of model inputs and monetization methods.

Remote cognitive behavioral therapy (CBT) for children with anxiety

Children's Mental Health: Anxiety

Benefit-cost estimates updated December 2017. Literature review updated April 2012.

Program Description: These treatments utilize the same principles and techniques as those of other Cognitive Behavior Therapy (CBT) treatments for anxiety (e.g., strategies to control physiological responses to anxiety, cognitive restructuring and self-talk, exposure to feared stimuli, and positive reinforcement). However, they are unique insofar as clients have reduced (if any) face-to-face time with therapists. Clients are supported remotely via email or phone contact. A manual or online program helps to guide progress of the intervention.

Benefit-Cost Summary Statistics Per Participant

Benefits to:

Taxpayers	\$2,017	Benefit to cost ratio	n/a
Participants	\$3,977	Benefits minus costs	\$7,599
Others	\$296	Chance the program will produce	
Indirect	\$518	benefits greater than the costs	93 %
Total benefits	\$6,808		
Net program cost	\$791		
Benefits minus cost	\$7,599		

The estimates shown are present value, life cycle benefits and costs. All dollars are expressed in the base year chosen for this analysis (2016). The chance the benefits exceed the costs are derived from a Monte Carlo risk analysis. The details on this, as well as the economic discount rates and other relevant parameters are described in our [Technical Documentation](#).

Detailed Monetary Benefit Estimates Per Participant

Benefits from changes to: ¹	Benefits to:				
	Participants	Taxpayers	Others ²	Indirect ³	Total
K-12 grade repetition	\$0	\$8	\$0	\$4	\$11
Labor market earnings associated with major depression	\$1	\$1	\$0	\$0	\$2
Health care associated with major depression	\$0	\$0	\$0	\$0	\$0
Labor market earnings associated with anxiety disorder	\$3,918	\$1,779	\$0	\$0	\$5,698
Health care associated with anxiety disorder	\$80	\$244	\$302	\$123	\$749
Costs of higher education	(\$22)	(\$15)	(\$7)	(\$7)	(\$50)
Adjustment for deadweight cost of program	\$0	\$0	\$0	\$399	\$399
Totals	\$3,977	\$2,017	\$296	\$518	\$6,808

¹In addition to the outcomes measured in the meta-analysis table, WSIPP measures benefits and costs estimated from other outcomes associated with those reported in the evaluation literature. For example, empirical research demonstrates that high school graduation leads to reduced crime. These associated measures provide a more complete picture of the detailed costs and benefits of the program.

²"Others" includes benefits to people other than taxpayers and participants. Depending on the program, it could include reductions in crime victimization, the economic benefits from a more educated workforce, and the benefits from employer-paid health insurance.

³"Indirect benefits" includes estimates of the net changes in the value of a statistical life and net changes in the deadweight costs of taxation.

Detailed Annual Cost Estimates Per Participant

	Annual cost	Year dollars	Summary	
Program costs	\$217	2010	Present value of net program costs (in 2016 dollars)	\$791
Comparison costs	\$943	2010		Cost range (+ or -)

Per-participant costs are based on average therapist time, as reported in the treatment studies. Hourly therapist cost is based on the actuarial estimates of reimbursement by modality (Mercer. (2013). *Behavioral Health Data Book for the State of Washington for Rates Effective January 1, 2014*). Comparison costs are based on the average reimbursement for treatment of child anxiety.

The figures shown are estimates of the costs to implement programs in Washington. The comparison group costs reflect either no treatment or treatment as usual, depending on how effect sizes were calculated in the meta-analysis. The cost range reported above reflects potential variation or uncertainty in the cost estimate; more detail can be found in our [Technical Documentation](#).

Detailed Annual Cost Estimates Per Participant

The graph above illustrates the estimated cumulative net benefits per-participant for the first fifty years beyond the initial investment in the program. We present these cash flows in non-discounted dollars to simplify the “break-even” point from a budgeting perspective. If the dollars are negative (bars below \$0 line), the cumulative benefits do not outweigh the cost of the program up to that point in time. The program breaks even when the dollars reach \$0. At this point, the total benefits to participants, taxpayers, and others, are equal to the cost of the program. If the dollars are above \$0, the benefits of the program exceed the initial investment.

Meta-Analysis of Program Effects

Outcomes measured	No. of effect sizes	Treatment N	Adjusted effect sizes and standard errors used in the benefit-cost analysis						Unadjusted effect size (random effects model)	
			First time ES is estimated			Second time ES is estimated			ES	p-value
			ES	SE	Age	ES	SE	Age		
Anxiety disorder	5	210	-0.439	0.285	11	-0.203	0.142	12	-1.141	0.001
Global functioning [^]	2	46	0.451	0.212	11	0.209	0.110	12	1.074	0.001
Major depressive disorder ^{^^}	1	30	0.000	0.260	11	0.000	0.021	12	0.000	1.000

[^]WSIPP’s benefit-cost model does not monetize this outcome.

^{^^}WSIPP does not include this outcome when conducting benefit-cost analysis for this program.

Meta-analysis is a statistical method to combine the results from separate studies on a program, policy, or topic in order to estimate its effect on an outcome. WSIPP systematically evaluates all credible evaluations we can locate on each topic. The outcomes measured are the types of program impacts that were measured in the research literature (for example, crime or educational attainment). Treatment N represents the total number of individuals or units in the treatment group across the included studies.

An effect size (ES) is a standard metric that summarizes the degree to which a program or policy affects a measured outcome. If the effect size is positive, the outcome increases. If the effect size is negative, the outcome decreases.

Adjusted effect sizes are used to calculate the benefits from our benefit cost model. WSIPP may adjust effect sizes based on methodological characteristics of the study. For example, we may adjust effect sizes when a study has a weak research design or when the program developer is involved in the research. The magnitude of these adjustments varies depending on the topic area.

WSIPP may also adjust the second ES measurement. Research shows the magnitude of some effect sizes decrease over time. For those effect sizes, we estimate outcome-based adjustments which we apply between the first time ES is estimated and the second time ES is estimated. We also report the unadjusted effect size to show the effect sizes before any adjustments have been made. More details about these adjustments can be found in our [Technical Documentation](#).

Acceptance and Commitment Therapy (ACT) for children with anxiety

Children's Mental Health: Anxiety

Benefit-cost estimates updated December 2017. Literature review updated August 2017.

Program Description: Acceptance and Commitment Therapy for anxiety aims to increase client acceptance of negative thoughts and feelings and to reduce the negative behavioral impact of anxiety. Acceptance and Commitment Therapy relies on six core processes of change: 1) acceptance; 2) learning to view thoughts as hypotheses rather than facts, 3) being present, 4) viewing the self as context for experience, 5) identifying core values, and 6) acting based on those values. These core principles are applied through various exercises and through homework. In the single study reported here, the treatment was delivered in 10 group sessions with parents present at all sessions.

Benefit-Cost Summary Statistics Per Participant

Benefits to:			
Taxpayers	\$1,998	Benefit to cost ratio	n/a
Participants	\$3,972	Benefits minus costs	\$6,901
Others	\$271	Chance the program will produce	
Indirect	\$294	benefits greater than the costs	99 %
Total benefits	\$6,534		
Net program cost	\$367		
Benefits minus cost	\$6,901		

The estimates shown are present value, life cycle benefits and costs. All dollars are expressed in the base year chosen for this analysis (2016). The chance the benefits exceed the costs are derived from a Monte Carlo risk analysis. The details on this, as well as the economic discount rates and other relevant parameters are described in our [Technical Documentation](#).

The magnitude of these adjustments varies depending on the topic area.

WSIPP may also adjust the second ES measurement. Research shows the magnitude of some effect sizes decrease over time. For those effect sizes, we estimate outcome-based adjustments which we apply between the first time ES is estimated and the second time ES is estimated. We also report the unadjusted effect size to show the effect sizes before any adjustments have been made. More details about these adjustments can be found in our [Technical Documentation](#).

Parent cognitive behavioral therapy (CBT) for young children with anxiety

Children's Mental Health: Anxiety

Benefit-cost estimates updated December 2017. Literature review updated April 2012.

Program Description: Parents received training in cognitive behavioral approaches to use with their anxious children. Approaches usually include multiple components, such as strategies to control physiological responses to anxiety, cognitive restructuring and self-talk, exposure to feared stimuli, and positive reinforcement. This brief therapy can be administered in individual, group, or family format. Well-known examples include the Coping Cat and Coping Koala programs.

Benefit-Cost Summary Statistics Per Participant

Benefits to:			
Taxpayers	\$468	Benefit to cost ratio	n/a
Participants	\$913	Benefits minus costs	\$2,459
Others	\$75	Chance the program will produce	
Indirect	\$355	benefits greater than the costs	99 %
<u>Total benefits</u>	<u>\$1,811</u>		
<u>Net program cost</u>	<u>\$648</u>		
Benefits minus cost	\$2,459		

The estimates shown are present value, life cycle benefits and costs. All dollars are expressed in the base year chosen for this analysis (2016). The chance the benefits exceed the costs are derived from a Monte Carlo risk analysis. The details on this, as well as the economic discount rates and other relevant parameters are described in our [Technical Documentation](#).

Detailed Monetary Benefit Estimates Per Participant

Benefits from changes to: ¹	Benefits to:				
	Participants	Taxpayers	Others ²	Indirect ³	Total
K-12 grade repetition	\$0	\$2	\$0	\$1	\$2
Labor market earnings associated with anxiety disorder	\$898	\$408	\$0	\$0	\$1,306
Health care associated with anxiety disorder	\$20	\$61	\$76	\$31	\$188
Costs of higher education	(\$5)	(\$3)	(\$1)	(\$2)	(\$11)
Adjustment for deadweight cost of program	\$0	\$0	\$0	\$325	\$325
Totals	\$913	\$468	\$75	\$355	\$1,811

¹In addition to the outcomes measured in the meta-analysis table, WSIPP measures benefits and costs estimated from other outcomes associated with those reported in the evaluation literature. For example, empirical research demonstrates that high school graduation leads to reduced crime. These associated measures provide a more complete picture of the detailed costs and benefits of the program.

²"Others" includes benefits to people other than taxpayers and participants. Depending on the program, it could include reductions in crime victimization, the economic benefits from a more educated workforce, and the benefits from employer-paid health insurance.

³"Indirect benefits" includes estimates of the net changes in the value of a statistical life and net changes in the deadweight costs of taxation.

Detailed Annual Cost Estimates Per Participant

	Annual cost	Year dollars	Summary	
Program costs	\$348	2010	Present value of net program costs (in 2016 dollars)	\$648
Comparison costs	\$943	2010	Cost range (+ or -)	10 %

Per-participant costs are based on average therapist time, as reported in the treatment studies. Hourly therapist cost is based on the actuarial estimates of reimbursement by modality (Mercer. (2013). *Behavioral Health Data Book for the State of Washington for Rates Effective January 1, 2014*). Comparison cost is based on the average reimbursement for treatment of child anxiety.

The figures shown are estimates of the costs to implement programs in Washington. The comparison group costs reflect either no treatment or treatment as usual, depending on how effect sizes were calculated in the meta-analysis. The cost range reported above reflects potential variation or uncertainty in the cost estimate; more detail can be found in our [Technical Documentation](#).

Detailed Annual Cost Estimates Per Participant

The graph above illustrates the estimated cumulative net benefits per-participant for the first fifty years beyond the initial investment in the program. We present these cash flows in non-discounted dollars to simplify the “break-even” point from a budgeting perspective. If the dollars are negative (bars below \$0 line), the cumulative benefits do not outweigh the cost of the program up to that point in time. The program breaks even when the dollars reach \$0. At this point, the total benefits to participants, taxpayers, and others, are equal to the cost of the program. If the dollars are above \$0, the benefits of the program exceed the initial investment.

Meta-Analysis of Program Effects

Outcomes measured	No. of effect sizes	Treatment N	Adjusted effect sizes and standard errors used in the benefit-cost analysis						Unadjusted effect size (random effects model)	
			First time ES is estimated			Second time ES is estimated			ES	p-value
			ES	SE	Age	ES	SE	Age		
Anxiety disorder	3	135	-0.266	0.155	6	-0.123	0.078	7	-0.842	0.013

Meta-analysis is a statistical method to combine the results from separate studies on a program, policy, or topic in order to estimate its effect on an outcome. WSIPP systematically evaluates all credible evaluations we can locate on each topic. The outcomes measured are the types of program impacts that were measured in the research literature (for example, crime or educational attainment). Treatment N represents the total number of individuals or units in the treatment group across the included studies.

An effect size (ES) is a standard metric that summarizes the degree to which a program or policy affects a measured outcome. If the effect size is positive, the outcome increases. If the effect size is negative, the outcome decreases.

Adjusted effect sizes are used to calculate the benefits from our benefit cost model. WSIPP may adjust effect sizes based on methodological characteristics of the study. For example, we may adjust effect sizes when a study has a weak research design or when the program developer is involved in the research. The magnitude of these adjustments varies depending on the topic area.

WSIPP may also adjust the second ES measurement. Research shows the magnitude of some effect sizes decrease over time. For those effect sizes, we estimate outcome-based adjustments which we apply between the first time ES is estimated and the second time ES is estimated. We also report the unadjusted effect size to show the effect sizes before any adjustments have been made. More details about these adjustments can be found in our [Technical Documentation](#).

Behavioral parent training (BPT) for children with ADHD

Children's Mental Health: Attention Deficit Hyperactivity Disorder

Benefit-cost estimates updated December 2017. Literature review updated April 2012.

Program Description: This is a brief intervention (spanning a couple of months) that involves psychoeducation on ADHD and teaching parents behavior management techniques, such as reinforcement and teacher correspondence. Parent programs were delivered in either individual or group format. Many studies utilize or build on Barkley's Defiant Children program.

Benefit-Cost Summary Statistics Per Participant

Benefits to:			
Taxpayers	\$101	Benefit to cost ratio	n/a
Participants	\$159	Benefits minus costs	\$552
Others	\$110	Chance the program will produce	
Indirect	\$70	benefits greater than the costs	91 %
Total benefits	\$439		
Net program cost	\$113		
Benefits minus cost	\$552		

The estimates shown are present value, life cycle benefits and costs. All dollars are expressed in the base year chosen for this analysis (2016). The chance the benefits exceed the costs are derived from a Monte Carlo risk analysis. The details on this, as well as the economic discount rates and other relevant parameters are described in our [Technical Documentation](#).

Cognitive behavioral therapy (CBT) for children with ADHD

Children's Mental Health: Attention Deficit Hyperactivity Disorder

Benefit-cost estimates updated December 2017. Literature review updated April 2012.

Program Description: Cognitive training and cognitive-behavioral therapies are included in this program grouping. Both target problem-solving in order to reduce impulsive behavior; specific strategies include self-monitoring, modeling/role playing, self-instruction, generation of alternatives, and reinforcement.

Benefit-Cost Summary Statistics Per Participant

Benefits to:			
Taxpayers	(\$146)	Benefit to cost ratio	(\$1.01)
Participants	(\$216)	Benefits minus costs	(\$2,108)

Multimodal Therapy (MMT) for children with ADHD

Children's Mental Health: Attention Deficit Hyperactivity Disorder

Benefit-cost estimates updated December 2017. Literature review updated April 2012.

Program Description: These treatments target more than one dimension with psychosocial interventions. For instance, many therapies provide behavioral training to parents, school consultations with teachers, and self-control training with children. In this analysis, all studies utilized either behavioral or cognitive-behavioral orientations.

Benefit-Cost Summary Statistics Per Participant

Benefits to:			
Taxpayers	\$2,698	Benefit to cost ratio	\$0.66

Detailed Annual Cost Estimates Per Participant

The graph above illustrates the estimated cumulative net benefits per-participant for the first fifty years beyond the initial investment in the program. We present these cash flows in non-discounted dollars to simplify the “break-even” point from a budgeting perspective. If the dollars are negative (bars below \$0 line), the cumulative benefits do not outweigh the cost of the program up to that point in time. The program breaks even when the dollars reach \$0. At this point, the total benefits to participants, taxpayers, and others, are equal to the cost of the program. If the dollars are above \$0, the benefits of the program exceed the initial investment.

Meta-Analysis of Program Effects

Outcomes measured	No. of effect sizes	Treatment N	Adjusted effect sizes and standard errors used in the benefit-cost analysis						Unadjusted effect size (random effects model)	
			First time ES is estimated			Second time ES is estimated			ES	p-value
			ES	SE	Age	ES	SE	Age		
Attention-deficit/hyperactivity disorder symptoms	9	453	-0.079	0.079	9	0.000	0.005	10	-0.186	0.125
Crime	1	81	-0.430	0.230	16	-0.430	0.230	26	-0.430	0.062
Disruptive behavior disorder symptoms	7	362	-0.229	0.096	9	-0.109	0.068	12	-0.341	0.007
Global functioning [^]	1	30	0.141	0.256	9	0.000	0.011	10	0.151	0.582
Test scores	5	324	0.023	0.079	9	0.014	0.087	17	0.023	0.774

[^]WSIPP's benefit-cost model does not monetize this outcome.

Meta-analysis is a statistical method to combine the results from separate studies on a program, policy, or topic in order to estimate its effect on an outcome. WSIPP systematically evaluates all credible evaluations we can locate on each topic. The outcomes measured are the types of program impacts that were measured in the research literature (for example, crime or educational attainment). Treatment N represents the total number of individuals or units in the treatment group across the included studies.

An effect size (ES) is a standard metric that summarizes the degree to which a program or policy affects a measured outcome. If the effect size is positive, the outcome increases. If the effect size is negative, the outcome decreases.

Adjusted effect sizes are used to calculate the benefits from our benefit cost model. WSIPP may adjust effect sizes based on methodological characteristics of the study. For example, we may adjust effect sizes when a study has a weak research design or when the program developer is involved in the research. The magnitude of these adjustments varies depending on the topic area.

WSIPP may also adjust the second ES measurement. Research shows the magnitude of some effect sizes decrease over time. For those effect sizes, we estimate outcome-based adjustments which we apply between the first time ES is estimated and the second time ES is estimated. We also report the unadjusted effect size to show the effect sizes before any adjustments have been made. More details about these adjustments can be found in our [Technical Documentation](#).

Blues Program

Children's Mental Health: Depression

Benefit-cost estimates updated December 2017. Literature review updated May 2015.

Program Description: This prevention program targets high school and college students with depressive symptoms who do not have major depression. The program consists of six weekly one-hour group sessions and home practice assignments. Sessions focus on engaging in pleasant activities, cognitive restructuring techniques, and response plans for future life stressors.

Benefit-Cost Summary Statistics Per Participant

Benefits to:			
Taxpayers	\$11	Benefit to cost ratio	(\$0.24)
Participants	\$1	Benefits minus costs	(\$144)
Others	\$12	Chance the program will produce	
Indirect	(\$52)	benefits greater than the costs	41 %
<u>Total benefits</u>	<u>(\$28)</u>		
<u>Net program cost</u>	<u>(\$116)</u>		
Benefits minus cost	(\$144)		

The estimates shown are present value, life cycle benefits and costs. All dollars are expressed in the base year chosen for this analysis (2016). The chance the benefits exceed the costs are derived from a Monte Carlo risk analysis. The details on this, as well as the economic discount rates and other relevant parameters are described in our [Technical Documentation](#).

Detailed Monetary Benefit Estimates Per Participant

Benefits from changes to: ¹	Benefits to:				
	Participants	Taxpayers	Others ²	Indirect ³	Total
K-12 grade repetition	\$0	\$3	\$0	\$1	\$4
Labor market earnings associated with major depression	\$6	\$3	\$0	\$2	\$10
Health care associated with major depression	\$4	\$12	\$14	\$6	\$35
Costs of higher education	(\$8)	(\$6)	(\$3)	(\$3)	(\$19)
Adjustment for deadweight cost of program	\$0	\$0	\$0	(\$58)	(\$58)
<u>Totals</u>	<u>\$1</u>	<u>\$11</u>	<u>\$12</u>	<u>(\$52)</u>	<u>(\$28)</u>

¹In addition to the outcomes measured in the meta-analysis table, WSIPP measures benefits and costs estimated from other outcomes associated with those reported in the evaluation literature. For example, empirical research demonstrates that high school graduation leads to reduced crime. These associated measures provide a more complete picture of the detailed costs and benefits of the program.

²"Others" includes benefits to people other than taxpayers and participants. Depending on the program, it could include reductions in crime victimization, the economic benefits from a more educated workforce, and the benefits from employer-paid health insurance.

³"Indirect benefits" includes estimates of the net changes in the value of a statistical life and net changes in the deadweight costs of taxation.

Detailed Annual Cost Estimates Per Participant

	Annual cost	Year dollars	Summary	
Program costs	\$114	2014	Present value of net program costs (in 2016 dollars)	(\$116)
Comparison costs	\$0	2014	Cost range (+ or -)	10 %

The Blues Program typically consists of six 1-hour group sessions. In the studies we reviewed, there was an average of 6.85 students per group with an average of 73 students served by each teaching team. The program was team-taught by either a graduate student and undergraduate assistant or two school personnel (typically a school counselor or school nurse). We used the average salary and benefits for a certified school counselor and certified school nurse in the 2014-2015 school year (<http://www.k12.wa.us/safs/PUB/PER/1415/ps.asp>) as the cost for staff time. Program leaders received an average of ten hours of training.

The figures shown are estimates of the costs to implement programs in Washington. The comparison group costs reflect either no treatment or treatment as usual, depending on how effect sizes were calculated in the meta-analysis. The cost range reported above reflects potential variation or uncertainty in the cost estimate; more detail can be found in our [Technical Documentation](#).

Detailed Annual Cost Estimates Per Participant

The graph above illustrates the estimated cumulative net benefits per-participant for the first fifty years beyond the initial investment in the program. We present these cash flows in non-discounted dollars to simplify the “break-even” point from a budgeting perspective. If the dollars are negative (bars below \$0 line), the cumulative benefits do not outweigh the cost of the program up to that point in time. The program breaks even when the dollars reach \$0. At this point, the total benefits to participants, taxpayers, and others, are equal to the cost of the program. If the dollars are above \$0, the benefits of the program exceed the initial investment.

Meta-Analysis of Program Effects

Outcomes measured	No. of effect sizes	Treatment N	Adjusted effect sizes and standard errors used in the benefit-cost analysis						Unadjusted effect size (random effects model)	
			First time ES is estimated			Second time ES is estimated			ES	p-value
			ES	SE	Age	ES	SE	Age		
Major depressive disorder	4	292	-0.201	0.125	18	0.000	0.019	19	-0.313	0.015

Meta-analysis is a statistical method to combine the results from separate studies on a program, policy, or topic in order to estimate its effect on an outcome. WSIPP systematically evaluates all credible evaluations we can locate on each topic. The outcomes measured are the types of program impacts that were measured in the research literature (for example, crime or educational attainment). Treatment N represents the total number of individuals or units in the treatment group across the included studies.

An effect size (ES) is a standard metric that summarizes the degree to which a program or policy affects a measured outcome. If the effect size is positive, the outcome increases. If the effect size is negative, the outcome decreases.

Adjusted effect sizes are used to calculate the benefits from our benefit cost model. WSIPP may adjust effect sizes based on methodological characteristics of the study. For example, we may adjust effect sizes when a study has a weak research design or when the program developer is involved in the research. The magnitude of these adjustments varies depending on the topic area.

WSIPP may also adjust the second ES measurement. Research shows the magnitude of some effect sizes decrease over time. For those effect sizes, we estimate outcome-based adjustments which we apply between the first time ES is estimated and the second time ES is estimated. We also report the unadjusted effect size to show the effect sizes before any adjustments have been made. More details about these adjustments can be found in our [Technical Documentation](#).

Cognitive behavioral therapy (CBT) for children & adolescents with depression

Children's Mental Health: Depression

Benefit-cost estimates updated December 2017. Literature review updated August 2017.

Program Description: Cognitive behavioral therapies (CBT) include various components, such as cognitive restructuring, scheduling pleasant experiences, emotion regulation, communication skills, and problem-solving. In this review, CBT is provided to children and adolescents aged 7 to 17 with major or minor depression, dysthymia, or subthreshold depression. We include programs such as Coping With Depression – Adolescent (CWD-A), Primary and Secondary Control Enhancement Training (PASCET), the Treatment for Adolescents with Depression (TADS) Study, and other CBT models. On average, treatments in this review provided 14 therapeutic hours per client over three months, with a range of 6 to 28 therapeutic hours per client. Therapies were provided in both individual and group modalities.

Benefit-Cost Summary Statistics Per Participant

Benefits to:			
Taxpayers	\$36	Benefit to cost ratio	(\$0.27)
Participants	\$7	Benefits minus costs	(\$566)
Others	\$37	Chance the program will produce	
Indirect	(\$201)	benefits greater than the costs	31 %
<u>Total benefits</u>	<u>(\$122)</u>		
<u>Net program cost</u>	<u>(\$444)</u>		
Benefits minus cost	(\$566)		

The estimates shown are present value, life cycle benefits and costs. All dollars are expressed in the base year chosen for this analysis (2016). The chance the benefits exceed the costs are derived from a Monte Carlo risk analysis. The details on this, as well as the economic discount rates and other relevant parameters are described in our [Technical Documentation](#).

<u>Totals</u>	<u>\$7</u>	<u>\$36</u>	<u>\$37</u>	<u>(\$201)</u>	<u>(\$122)</u>

¹In addition to the outcomes measured in the meta-analysis table, WSIPP measures benefits and costs estimated from other outcomes associated with those reported in the evaluation literature. For example, empirical research demonstrates that high school graduation leads to reduced crime. These associated measures provide a more complete picture of the detailed costs and benefits of the program.

²"Others" includes benefits to people other than taxpayers and participants. Depending on the program, it could include reductions in crime victimization, the economic benefits from a more educated workforce, and the benefits from employer-paid health insurance.

³"Indirect benefits" includes estimates of the net changes in the value of a statistical life and net changes in the deadweight costs of taxation.

Detailed Annual Cost Estimates Per Participant

	Annual cost	Year dollars	Summary	
Program costs	\$1,245	2015	Present value of net program costs (in 2016 dollars)	(\$444)
Comparison costs	\$806	2015	Cost range (+ or -)	15 %

On average, participants received 14 therapeutic hours. The per-participant cost of treatment by modality (individual or group) was weighted by the treatment Ns reported in the studies. Cost per session is \$44.02/session for group and \$140.90/session for individual modalities (2015 dollars). This rate is based on actuarial tables reported in Mercer (2016) Behavioral Health Data Book for the State of Washington For Rates Effective January 1, 2017. Comparison group costs are based on the average cost of psychotherapy treatment as usual for children and adolescents with depression, based on a WSIPP analysis.

The figures shown are estimates of the costs to implement programs in Washington. The comparison group costs reflect either no treatment or treatment as usual, depending on how effect sizes were calculated in the meta-analysis. The cost range reported above reflects potential variation or uncertainty in the cost estimate; more detail can be found in our [Technical Documentation](#).

Detailed Annual Cost Estimates Per Participant

The graph above illustrates the estimated cumulative net benefits per-participant for the first fifty years beyond the initial investment in the program. We present these cash flows in non-discounted dollars to simplify the “break-even” point from a budgeting perspective. If the dollars are negative (bars below \$0 line), the cumulative benefits do not outweigh the cost of the program up to that point in time. The program breaks even when the dollars reach \$0. At this point, the total benefits to participants, taxpayers, and others, are equal to the cost of the program. If the dollars are above \$0, the benefits of the program exceed the initial investment.

Meta-Analysis of Program Effects

Acceptance and Commitment Therapy (ACT) for children with depression

Children's Mental Health: Depression

Benefit-cost estimates updated December 2017. Literature review updated August 2017.

Program Description: Acceptance and Commitment Therapy (ACT) for depression aims to increase client acceptance of negative thoughts and feelings and to reduce the negative behavioral impact of depression. Acceptance and Commitment Therapy relies on six core processes of change: 1) acceptance; 2) learning to view thoughts as hypotheses rather than facts, 3) being present, 4) viewing the self as context for experience, 5) identifying core values, and 6) acting based on those values. These core principles are applied through various exercises and through homework. In the two studies included in this analysis, ACT was delivered either in 10 group or 20 individual sessions.

Benefit-Cost Summary Statistics Per Participant

Benefits to:			
Taxpayers	\$30	Benefit to cost ratio	(\$0.26)
Participants	\$19	Benefits minus costs	(\$755)
Others	\$31	Chance the program will produce	
Indirect	(\$237)	benefits greater than the costs	31 %
<u>Total benefits</u>	<u>(\$157)</u>		
<u>Net program cost</u>	<u>(\$598)</u>		
Benefits minus cost	(\$755)		

The estimates shown are present value, life cycle benefits and costs. All dollars are expressed in the base year chosen for this analysis (2016). The chance the benefits exceed the costs are derived from a Monte Carlo risk analysis. The details on this, as well as the economic discount rates and other relevant parameters are described in our [Technical Documentation](#).

Detailed Monetary Benefit Estimates Per Participant

Benefits from changes to: ¹	Benefits to:				
	Participants	Taxpayers	Others ²	Indirect ³	Total
K-12 grade repetition	\$0	\$0	\$0	\$0	\$0
Labor market earnings associated with major depression	\$10	\$5	\$0	\$49	\$64
Health care associated with major depression	\$8	\$25	\$31	\$13	\$78
Costs of higher education	\$0	\$0	\$0	\$0	\$0
Adjustment for deadweight cost of program	\$0	\$0	\$0	(\$300)	(\$300)
Totals	\$19	\$30	\$31	(\$237)	(\$157)

¹In addition to the outcomes measured in the meta-analysis table, WSIPP measures benefits and costs estimated from other outcomes associated with those reported in the evaluation literature. For example, empirical research demonstrates that high school graduation leads to reduced crime. These associated measures provide a more complete picture of the detailed costs and benefits of the program.

²"Others" includes benefits to people other than taxpayers and participants. Depending on the program, it could include reductions in crime victimization, the economic benefits from a more educated workforce, and the benefits from employer-paid health insurance.

³"Indirect benefits" includes estimates of the net changes in the value of a statistical life and net changes in the deadweight costs of taxation.

Detailed Annual Cost Estimates Per Participant

	Annual cost	Year dollars	Summary	
Program costs	\$1,417	2016	Present value of net program costs (in 2016 dollars)	(\$598)
Comparison costs	\$753	2010	Cost range (+ or -)	15 %

The therapy in this study included 10 group or 20 individual sessions. Per-participant costs are based on weighted average therapist time as reported in the studies, multiplied by DSHS reimbursement rates reported in Mercer (2015) Behavioral Health Data Book for the State of Washington For Rates Effective January 1, 2016. Comparison costs are based on the average reimbursement for treatment of child depression.

The figures shown are estimates of the costs to implement programs in Washington. The comparison group costs reflect either no treatment or treatment as usual, depending on how effect sizes were calculated in the meta-analysis. The cost range reported above reflects potential variation or uncertainty in the cost estimate; more detail can be found in our [Technical Documentation](#).

Detailed Annual Cost Estimates Per Participant

The graph above illustrates the estimated cumulative net benefits per-participant for the first fifty years beyond the initial investment in the program. We present these cash flows in non-discounted dollars to simplify the “break-even” point from a budgeting perspective. If the dollars are negative (bars below \$0 line), the cumulative benefits do not outweigh the cost of the program up to that point in time. The program breaks even when the dollars reach \$0. At this point, the total benefits to participants, taxpayers, and others, are equal to the cost of the program. If the dollars are above \$0, the benefits of the program exceed the initial investment.

Meta-Analysis of Program Effects

Outcomes measured	No. of effect sizes	Treatment N	Adjusted effect sizes and standard errors used in the benefit-cost analysis						Unadjusted effect size (random effects model)	
			First time ES is estimated			Second time ES is estimated			ES	p-value
			ES	SE	Age	ES	SE	Age		
Major depressive disorder	2	46	-0.281	0.232	15	0.000	0.030	16	-0.438	0.061

Meta-analysis is a statistical method to combine the results from separate studies on a program, policy, or topic in order to estimate its effect on an outcome. WSIPP systematically evaluates all credible evaluations we can locate on each topic. The outcomes measured are the types of program impacts that were measured in the research literature (for example, crime or educational attainment). Treatment N represents the total number of individuals or units in the treatment group across the included studies.

An effect size (ES) is a standard metric that summarizes the degree to which a program or policy affects a measured outcome. If the effect size is positive, the outcome increases. If the effect size is negative, the outcome decreases.

Adjusted effect sizes are used to calculate the benefits from our benefit cost model. WSIPP may adjust effect sizes based on methodological characteristics of the study. For example, we may adjust effect sizes when a study has a weak research design or when the program developer is involved in the research. The magnitude of these adjustments varies depending on the topic area.

WSIPP may also adjust the second ES measurement. Research shows the magnitude of some effect sizes decrease over time. For those effect sizes, we estimate outcome-based adjustments which we apply between the first time ES is estimated and the second time ES is estimated. We also report the unadjusted effect size to show the effect sizes before any adjustments have been made. More details about these adjustments can be found in our [Technical Documentation](#).

Other behavioral parent training (BPT) for children with disruptive behavior disorders

Children's Mental Health: Disruptive Behavior

Benefit-cost estimates updated December 2017. Literature review updated April 2012.

Program Description: In addition to several brand-name parenting programs, we grouped other brief treatments in which parents were taught behavior management skills and communication either alone or with their children (in a family format). In the studies included here, treatment duration ranged from two to six months, with weekly sessions.

Benefit-Cost Summary Statistics Per Participant

Benefits to:			
Taxpayers	\$680	Benefit to cost ratio	n/a
Participants	\$754	Benefits minus costs	\$2,383
Others	\$612	Chance the program will produce	
Indirect	\$224	benefits greater than the costs	89 %
Total benefits	\$2,271		
Net program cost	\$112		
Benefits minus cost	\$2,383		

The estimates shown are present value, life cycle benefits and costs. All dollars are expressed in the base year chosen for this analysis (2016). The chance the benefits exceed the costs are derived from a Monte Carlo risk analysis. The details on this, as well as the economic discount rates and other relevant parameters are described in our [Technical Documentation](#).

Detailed Monetary Benefit Estimates Per Participant

Benefits from changes to: ¹	Benefits to:				
	Participants	Taxpayers	Others ²	Indirect ³	Total
Crime	\$0	\$30	\$72	\$15	\$116
Labor market earnings associated with high school graduation	\$753	\$342	\$346	\$0	\$1,440
K-12 grade repetition	\$0	\$5	\$0	\$2	\$7
K-12 special education	\$0	\$169	\$0	\$84	\$254
Health care associated with disruptive behavior disorder	\$55	\$170	\$211	\$85	\$521
Costs of higher education	(\$54)	(\$36)	(\$16)	(\$18)	(\$123)
Adjustment for deadweight cost of program	\$0	\$0	\$0	\$56	\$56
Totals	\$754	\$680	\$612	\$224	\$2,271

¹In addition to the outcomes measured in the meta-analysis table, WSIPP measures benefits and costs estimated from other outcomes associated with those reported in the evaluation literature. For example, empirical research demonstrates that high school graduation leads to reduced crime. These associated measures provide a more complete picture of the detailed costs and benefits of the program.

²"Others" includes benefits to people other than taxpayers and participants. Depending on the program, it could include reductions in crime victimization, the economic benefits from a more educated workforce, and the benefits from employer-paid health insurance.

³"Indirect benefits" includes estimates of the net changes in the value of a statistical life and net changes in the deadweight costs of taxation.

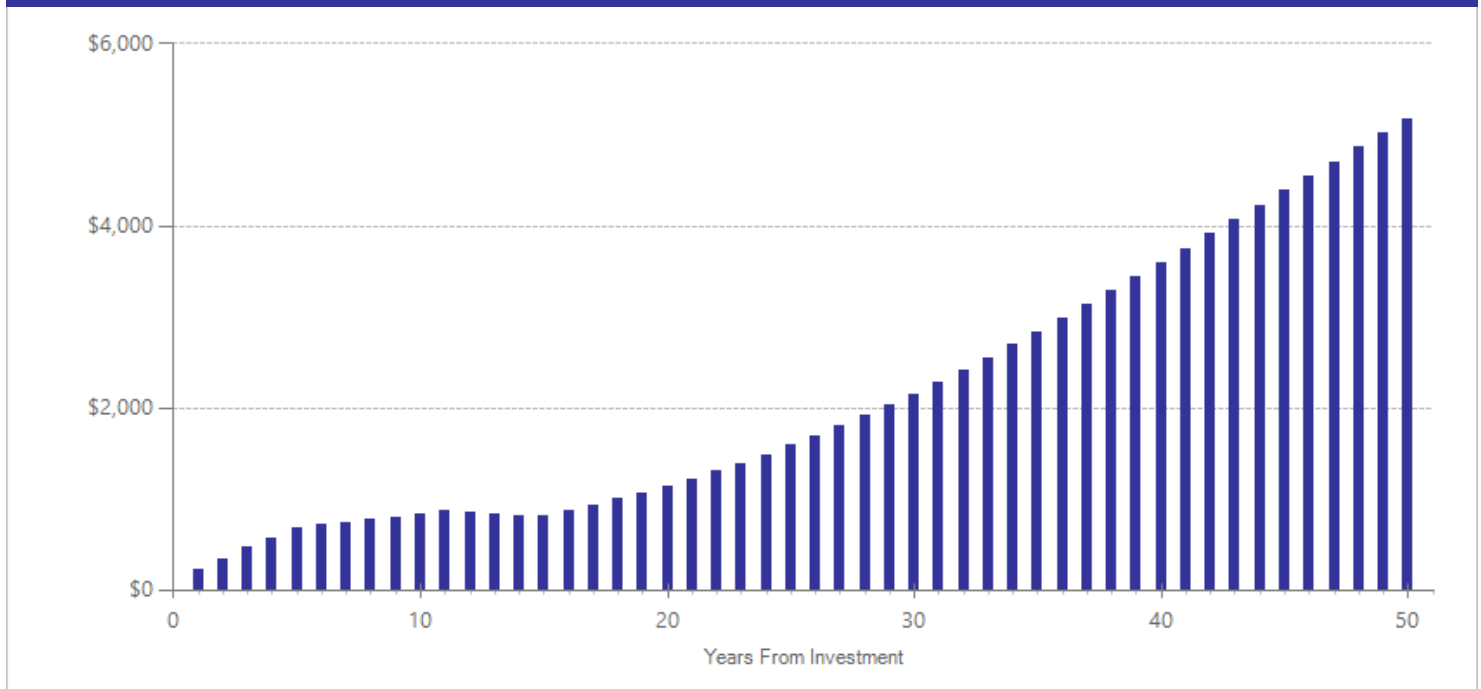

Detailed Annual Cost Estimates Per Participant

	Annual cost	Year dollars	Summary	
Program costs	\$778	2010	Present value of net program costs (in 2016 dollars)	\$112
Comparison costs	\$881	2010	Cost range (+ or -)	10 %

These interventions typically take place over a two- to six-month period. We estimated per-participant costs based on therapist time, as reported in the treatment studies. Hourly therapist cost was based on the latest actuarial estimates of reimbursement by modality in WA State (DSHS).

The figures shown are estimates of the costs to implement programs in Washington. The comparison group costs reflect either no treatment or treatment as usual, depending on how effect sizes were calculated in the meta-analysis. The cost range reported above reflects potential variation or uncertainty in the cost estimate; more detail can be found in our [Technical Documentation](#).

Triple-P Positive Parenting Program: Level 4, individual Children's Mental Health: Disruptive Behavior

Benefit-cost estimates updated December 2017. Literature review updated April 2012.

Program Description: Triple P—Positive Parenting Program (Level 4, self-directed) is an intensive individual-based parenting program for families of children with challenging behavior problems. In the self-directed modality, parents receive a full Level 4 curriculum with a workbook and exercises to complete at their own pace. They are also offered support from a therapist by telephone on a regular basis.

Benefit-Cost Summary Statistics Per Participant

Benefits to:			
Taxpayers	\$1,168	Benefit to cost ratio	\$3.36
Participants	\$1,255	Benefits minus costs	\$2,339
Others	\$1,098	Chance the program will produce	
Indirect	(\$191)	benefits greater than the costs	86 %
Total benefits	\$3,331		
Net program cost	(\$992)		
Benefits minus cost	\$2,339		

The estimates shown are present value, life cycle benefits and costs. All dollars are expressed in the base year chosen for this analysis (2016). The chance the benefits exceed the costs are derived from a Monte Carlo risk analysis. The details on this, as well as the economic discount rates and other relevant parameters are described in our [Technical Documentation](#).

Detailed Annual Cost Estimates Per Participant

	Annual cost	Year dollars	Summary	
Program costs	\$367	2010	Present value of net program costs (in 2016 dollars)	\$560
Comparison costs	\$881	2010	Cost range (+ or -)	20 %

This program typically consists of 10-16 sessions over a period of three to four months. Per-family costs are based on current Washington expenditures per family for individual behavioral treatment with Triple P, under the assumption that with group training, eight families could receive training at the same time from the same therapist. We also added an estimated cost for venue rental (a cost that is unnecessary when conducting the program with individual families).

The figures shown are estimates of the costs to implement programs in Washington. The comparison group costs reflect either no treatment or treatment as usual, depending on how effect sizes were calculated in the meta-analysis. The cost range reported above reflects potential variation or uncertainty in the cost estimate; more detail can be found in our [Technical Documentation](#).

Parent Child Interaction Therapy (PCIT) for children with disruptive behavior

Children's Mental Health: Disruptive Behavior

Benefit-cost estimates updated December 2017. Literature review updated April 2012.

Program Description: Parent Child Interaction Therapy (PCIT) is a program where a therapist directly observes a parent and child through a one-way mirror while providing direct coaching to the parent through a radio earphone. The focus is on building the skills of the parent to more positively interact with the child and manage his or her behavior. Therapists aim to ultimately restructure the parent-child relationship and provide the child with a more secure attachment to the parent.

Benefit-Cost Summary Statistics Per Participant

Benefits to:			
Taxpayers	\$1,154	Benefit to cost ratio	\$2.21
Participants	\$1,286	Benefits minus costs	\$1,704
Others	\$1,092	Chance the program will produce	
Indirect	(\$414)	benefits greater than the costs	78 %
Total benefits	\$3,118		
Net program cost	(\$1,414)		
Benefits minus cost	\$1,704		

The estimates shown are present value, life cycle benefits and costs. All dollars are expressed in the base year chosen for this analysis (2016). The chance the benefits exceed the costs are derived from a Monte Carlo risk analysis. Detailed Annual Cost Estimates Per Participant

	Annual cost	Year dollars	Summary	
Program costs	\$2,240	2007	Present value of net program costs (in 2016 dollars)	(\$1,414)
Comparison costs	\$1,000	2007	Cost range (+ or -)	10 %

This program is typically delivered over a three- to four-month period. Standard per-family PCIT expenditures provided by Washington State DSHS Children's Administration (average reimbursement rate for families receiving PCIT in Washington in 2007).

The figures shown are estimates of the costs to implement programs in Washington. The comparison group costs reflect either no treatment or treatment as usual, depending on how effect sizes were calculated in the meta-analysis. The cost range reported above reflects potential variation or uncertainty in the cost estimate; more detail can be found in our [Technical Documentation](#).

Detailed Annual Cost Estimates Per Participant

The graph above illustrates the estimated cumulative net benefits per-participant for the first fifty years beyond the initial investment in the program. We present these cash flows in non-discounted dollars to simplify the "break-even" point from a budgeting perspective. If the dollars are negative (bars below \$0 line), the cumulative benefits do not outweigh the cost of the program up to that point in time. The program breaks even when the dollars reach \$0. At this point, the total benefits to participants, taxpayers, and others, are equal to the cost of the program. If the dollars are above \$0, the benefits of the program exceed the initial investment.

Meta-Analysis of Program Effects

Outcomes measured	Primary or secondary participant	No. of effect sizes	Treatment N	Adjusted effect sizes and standard errors used in the benefit-cost analysis						Unadjusted effect size (random effects model)	
				First time ES is estimated			Second time ES is estimated			ES	p-value
				ES	SE	Age	ES	SE	Age		
Attention-deficit/hyperactivity disorder symptoms	Primary	4	87	-0.273	0.175	6	-0.001	0.016	7	-0.720	0.001
Disruptive behavior disorder symptoms	Primary	10	213	-0.392	0.102	6	-0.187	0.095	9	-1.045	0.001
Parental stress [^]	Secondary	5	145	-0.860	0.129	31	-0.447	0.158	32	-0.860	0.001

[^]WSIPP's benefit-cost model does not monetize this outcome.

Meta-analysis is a statistical method to combine the results from separate studies on a program, policy, or topic in order to estimate its effect on an outcome. WSIPP systematically evaluates all credible evaluations we can locate on each topic. The outcomes measured are the types of program impacts that were measured in the research literature (for example, crime or educational attainment). Treatment N represents the total number of individuals or units in the treatment group across the included studies.

An effect size (ES) is a standard metric that summarizes the degree to which a program or policy affects a measured outcome. If the effect size is positive, the outcome increases. If the effect size is negative, the outcome decreases.

Adjusted effect sizes are used to calculate the benefits from our benefit cost model. WSIPP may adjust effect sizes based on methodological characteristics of the study. For example, we may adjust effect sizes when a study has a weak research design or when the program developer is involved in the research. The magnitude of these adjustments varies depending on the topic area.

WSIPP may also adjust the second ES measurement. Research shows the magnitude of some effect sizes decrease over time. For those effect sizes, we estimate outcome-based adjustments which we apply between the first time ES is estimated and the second time ES is estimated. We also report the unadjusted effect size to show the effect sizes before any adjustments have been made. More details about these adjustments can be found in our [Technical Documentation](#).

Parent Management Training—Oregon Model (treatment population)

Children's Mental Health: Disruptive Behavior

Benefit-cost estimates updated December 2017. Literature review updated May 2015.

Program Description: Parent Management Training—Oregon Model (PMTO) is a family-based program that focuses on teaching parents to apply five parenting practices: skill encouragement, appropriate discipline, monitoring, problem solving, and positive involvement. This analysis focuses on the use of PMTO in populations with emerging or identified conduct problems.

Benefit-Cost Summary Statistics Per Participant

Benefits to:			
Taxpayers	\$698	Benefit to cost ratio	\$2.77
Participants	\$531	Benefits minus costs	\$1,234
Others	\$588	Chance the program will produce	
Indirect	\$115	benefits greater than the costs	84 %
Total benefits	\$1,932		
Net program cost	(\$698)		
Benefits minus cost	\$1,234		

The estimates shown are present value, life cycle benefits and costs. All dollars are expressed in the base year chosen for this analysis (2016). The chance the benefits exceed the costs are derived from a Monte Carlo risk analysis. The details on this, as well as the economic discount rates and other relevant parameters are described in our [Technical Documentation](#).

Detailed Monetary Benefit Estimates Per Participant

Benefits from changes to: ¹	Benefits to:				
	Participants	Taxpayers	Others ²	Indirect ³	Total
Crime	\$0	\$43	\$105	\$22	\$169
Labor market earnings associated with high school graduation	\$497	\$226	\$228	\$228	\$1,180
K-12 grade repetition	\$0	\$6	\$0	\$3	\$8
K-12 special education	\$0	\$233	\$0	\$117	\$350
Health care associated with disruptive behavior disorder	\$70	\$215	\$266	\$108	\$658
Costs of higher education	(\$37)	(\$24)	(\$11)	(\$12)	(\$84)
Adjustment for deadweight cost of program	\$0	\$0	\$0	(\$350)	(\$350)
Totals	\$531	\$698	\$588	\$115	\$1,932

¹In addition to the outcomes measured in the meta-analysis table, WSIPP measures benefits and costs estimated from other outcomes associated with those reported in the evaluation literature. For example, empirical research demonstrates that high school graduation leads to reduced crime. These associated measures provide a more complete picture of the detailed costs and benefits of the program.

²"Others" includes benefits to people other than taxpayers and participants. Depending on the program, it could include reductions in crime victimization, the economic benefits from a more educated workforce, and the benefits from employer-paid health insurance.

³"Indirect benefits" includes estimates of the net changes in the value of a statistical life and net changes in the deadweight costs of taxation.

Detailed Annual Cost Estimates Per Participant

	Annual cost	Year dollars	Summary	
Program costs	\$1,520	2011	Present value of net program costs (in 2016 dollars)	(\$698)
Comparison costs	\$863	2011	Cost range (+ or -)	10 %

This program was delivered in a group format and an individual family therapy format. An average of 14 staff hours were required to deliver the program to the families in the evaluations that we reviewed. The families in the comparison groups received an average of 7.95 staff hours. The type of provider varied widely depending on the delivery format and specific setting. We estimated the hourly staff costs from the reimbursement rates of therapeutic psychoeducation in the community for a non-disabled population, based on actuarial tables reported for disabled adults in Mercer. (2013). *Behavioral Health Data Book for the State of Washington for Rates Effective January 1, 2014*.

The figures shown are estimates of the costs to implement programs in Washington. The comparison group costs reflect either no treatment or treatment as usual, depending on how effect sizes were calculated in the meta-analysis. The cost range reported above reflects potential variation or uncertainty in the cost estimate; more detail can be found in our [Technical Documentation](#).

Detailed Annual Cost Estimates Per Participant

The graph above illustrates the estimated cumulative net benefits per-participant for the first fifty years beyond the initial investment in the program. We present these cash flows in non-discounted dollars to simplify the “break-even” point from a budgeting perspective. If the dollars are negative (bars below \$0 line), the cumulative benefits do not outweigh the cost of the program up to that point in time. The program breaks even when the dollars reach \$0. At this point, the total benefits to participants, taxpayers, and others, are equal to the cost of the program. If the dollars are above \$0, the benefits of the program exceed the initial investment.

Meta-Analysis of Program Effects

Outcomes measured	No. of effect sizes	Treatment N	Adjusted effect sizes and standard errors used in the benefit-cost analysis						Unadjusted effect size (random effects model)	
			First time ES is estimated			Second time ES is estimated			ES	p-value
			ES	SE	Age	ES	SE	Age		
Externalizing behavior symptoms	4	274	-0.271	0.090	8	-0.129	0.072	11	-0.271	0.003
Internalizing symptoms	3	232	-0.148	0.097	8	-0.108	0.086	10	-0.148	0.129

Meta-analysis is a statistical method to combine the results from separate studies on a program, policy, or topic in order to estimate its effect on an outcome. WSIPP systematically evaluates all credible evaluations we can locate on each topic. The outcomes measured are the types of program impacts that were measured in the research literature (for example, crime or educational attainment). Treatment N represents the total number of individuals or units in the treatment group across the included studies.

An effect size (ES) is a standard metric that summarizes the degree to which a program or policy affects a measured outcome. If the effect size is positive, the outcome increases. If the effect size is negative, the outcome decreases.

Adjusted effect sizes are used to calculate the benefits from our benefit cost model. WSIPP may adjust effect sizes based on methodological characteristics of the study. For example, we may adjust effect sizes when a study has a weak research design or when the program developer is involved in the research. The magnitude of these adjustments varies depending on the topic area.

WSIPP may also adjust the second ES measurement. Research shows the magnitude of some effect sizes decrease over time. For those effect sizes, we estimate outcome-based adjustments which we apply between the first time ES is estimated and the second time ES is estimated. We also report the unadjusted effect size to show the effect sizes before any adjustments have been made. More details about these adjustments can be found in our [Technical Documentation](#).

Collaborative primary care for children with behavior disorders

Children's Mental Health: Disruptive Behavior

Benefit-cost estimates updated December 2017. Literature review updated August 2017.

Program Description: Collaborative primary care for behavior disorders integrates behavioral health into the primary care setting to treat children and adolescents with oppositional defiance disorder, attention deficit/hyperactivity disorder, or other behavior disorders. In the collaborative care model, a care manager coordinates with a primary care provider and behavioral health care providers to develop and implement measurement-based treatment plans for individual patients. Care managers also provide psychoeducation and brief psychotherapy-based modules, such as cognitive behavioral therapy. Studies in this meta-analysis report on Doctor-Office Collaborative Care (DOCC), a specific collaborative care model. In the included studies, patients received collaborative care for six months. Patients in the comparison group received "enhanced" treatment as usual, which consisted of brief psychoeducation and referrals to usual mental health services.

Benefit-Cost Summary Statistics Per Participant

Benefits to:			
Taxpayers	\$466	Benefit to cost ratio	\$5.10
Participants	\$541	Benefits minus costs	\$1,127
Others	\$422	Chance the program will produce	
Indirect	(\$28)	benefits greater than the costs	73 %
Total benefits	\$1,401		
Net program cost	(\$275)		
Benefits minus cost	\$1,127		

The estimates shown are present value, life cycle benefits and costs. All dollars are expressed in the base year chosen for this analysis (2016). The chance the benefits exceed the costs are derived from a Monte Carlo risk analysis. The details on this, as well as the economic discount rates and other relevant parameters are described in our [Technical Documentation](#).

Incredible Years: Parent training Children's Mental Health: Disruptive Behavior

Benefit-cost estimates updated December 2017. Literature review updated April 2012.

Program Description: Incredible Years Parent Training (www.incredibleyears.com) is a group, skills-based behavioral intervention for parents of children with behavior problems. The curriculum focuses on strengthening parenting skills (monitoring, positive discipline, confidence) and fostering parents' involvement in children's school experiences in order to promote children's academic, social, and emotional competencies and reduce conduct problems. Training classes include child care, a family meal, and transportation.

Benefit-Cost Summary Statistics Per Participant

Benefits to:			
Taxpayers	\$934	Benefit to cost ratio	\$1.79

Detailed Annual Cost Estimates Per Participant

	Annual cost	Year dollars	Summary	
Program costs	\$2,215	2013	Present value of net program costs (in 2016 dollars)	(\$1,321)
Comparison costs	\$881	2010	Cost range (+ or -)	10 %

This intervention typically takes place over 12 to 16 weekly sessions. The costs to administer parent training classes per family were provided by Washington State DSHS Children’s Administration, 2012. WSIPP also added costs for practitioner training and curriculum for the parent classes, based on the findings of Foster et al., 2007 (training and curricula costs are low on a per-family basis, as curricula are shared between practitioners and distributed across many families who receive the intervention). Based on personal communication with Lisa St. George from Incredible Years (June 2014), we assumed that a practitioner team might use their purchased training and curricula to serve 24 families per year on average, for about five years (120 families served per team).

Foster, E.M., Olchowski, A.E., & Webster-Stratton, C.H. (2007). Is stacking intervention components cost-effective? An analysis of the Incredible Years program. *Journal of the American Academy of Child and Adolescent Psychiatry*, 46(11).

The figures shown are estimates of the costs to implement programs in Washington. The comparison group costs reflect either no treatment or treatment as usual, depending on how effect sizes were calculated in the meta-analysis. The cost range reported above reflects potential variation or uncertainty in the cost estimate; more detail can be found in our [Technical Documentation](#).

Detailed Annual Cost Estimates Per Participant

The graph above illustrates the estimated cumulative net benefits per-participant for the first fifty years beyond the initial investment in the program. We present these cash flows in non-discounted dollars to simplify the “break-even” point from a budgeting perspective. Multimodal Therapy (MMT) for children with disruptive behavior

Children's Mental Health: Disruptive Behavior

Benefit-cost estimates updated December 2017. Literature review updated April 2012.

Program Description: These treatments target more than one setting with psychosocial interventions. For instance, many therapies intervene with both parents and teachers. In this analysis, all studies utilized either behavioral or cognitive-behavioral orientations. Interventions included in our review varied in intensity (multiple times per day to biweekly) and duration (three to nine months).

Benefit-Cost Summary Statistics Per Participant

Benefits to:

Taxpayers	\$761	Benefit to cost ratio	\$1.70
Participants	\$1,446	Benefits minus costs	\$945
Others	\$726	Chance the program will produce	
Indirect	(\$629)	benefits greater than the costs	51 %
<u>Total benefits</u>	<u>\$2,303</u>		
<u>Net program cost</u>	<u>(\$1,358)</u>		
Benefits minus cost	\$945		

The estimates shown are present value, life cycle benefits and costs. All dollars are expressed in the base year chosen for this analysis (2016). The chance the benefits exceed the costs are derived from a Monte Carlo risk analysis. The details on this, as well as the economic discount rates and other relevant parameters are described in our [Technical Documentation](#).

Detailed Monetary Benefit Estimates Per Participant

Benefits from changes to:¹

Benefits to:

	Participants	Taxpayers	Others ²	Indirect ³	Total
Crime	\$0	\$9	\$21	\$4	\$34
Labor market earnings associated with test scores	\$1,451	\$659	\$639	\$0	\$2,750
K-12 grade repetition	\$0	\$1	\$0	\$1	\$2
K-12 special education	\$0	\$49	\$0	\$24	\$74
Health care associated with disruptive behavior disorder	\$19	\$59	\$73	\$29	\$180
Costs of higher education	(\$25)	(\$17)	(\$8)	(\$7)	(\$57)
Adjustment for deadweight cost of program	\$0	\$0	\$0	(\$680)	(\$680)
<u>Totals</u>	<u>\$1,446</u>	<u>\$761</u>	<u>\$726</u>	<u>(\$629)</u>	<u>\$2,303</u>

¹In addition to the outcomes measured in the meta-analysis table, WSIPP measures benefits and costs estimated from other outcomes associated with those reported in the evaluation literature. For example, empirical research demonstrates that high school graduation leads to reduced crime. These associated measures provide a more complete picture of the detailed costs and benefits of the program.

²"Others" includes benefits to people other than taxpayers and participants. Depending on the program, it could include reductions in crime victimization, the economic benefits from a more educated workforce, and the benefits from employer-paid health insurance.

³"Indirect benefits" includes estimates of the net changes in the value of a statistical life and net changes in the deadweight costs of taxation.

Detailed Annual Cost Estimates Per Participant

	Annual cost	Year dollars	Summary	
Program costs	\$2,128	2010	Present value of net program costs (in 2016 dollars)	(\$1,358)
Comparison costs	\$881	2010	Cost range (+ or -)	10 %

These interventions vary in length, typically taking place over a three- to nine-month period. We estimated per-participant costs based on therapist time, as reported in the treatment studies. Hourly therapist cost was based on the actuarial estimates of reimbursement by modality Mercer, (2013). *Behavioral Health Data Book for the State of Washington for Rates Effective January 1, 2014*.

The figures shown are estimates of the costs to implement programs in Washington. The comparison group costs reflect either no treatment or treatment as usual, depending on how effect sizes were calculated in the meta-analysis. The cost range reported above reflects potential variation or uncertainty in the cost estimate; more detail can be found in our [Technical Documentation](#).

Detailed Annual Cost Estimates Per Participant

The graph above illustrates the estimated cumulative net benefits per-participant for the first fifty years beyond the initial investment in the program. We present these cash flows in non-discounted dollars to simplify the “break-even” point from a budgeting perspective. If the dollars are negative (bars below \$0 line), the cumulative benefits do not outweigh the cost of the program up to that point in time. The program breaks even when the dollars reach \$0. At this point, the total benefits to participants, taxpayers, and others, are equal to the cost of the program. If the dollars are above \$0, the benefits of the program exceed the initial investment.

Meta-Analysis of Program Effects

Outcomes measured	No. of effect sizes	Treatment N	Adjusted effect sizes and standard errors used in the benefit-cost analysis						Unadjusted effect size (random effects model)	
			First time ES is estimated			Second time ES is estimated			ES	p-value
			ES	SE	Age	ES	SE	Age		
Attention-deficit/hyperactivity disorder symptoms	1	40	-0.027	0.221	6	0.000	0.011	9	-0.084	0.706
Disruptive behavior disorder symptoms	3	101	-0.054	0.174	8	-0.026	0.091	11	-0.274	0.524
Test scores	1	40	0.047	0.221	6	0.019	0.243	17	0.073	0.742

Meta-analysis is a statistical method to combine the results from separate studies on a program, policy, or topic in order to estimate its effect on an outcome. WSIPP systematically evaluates all credible evaluations we can locate on each topic. The outcomes measured are the types of program impacts that were measured in the research literature (for example, crime or educational attainment). Treatment N represents the total number of individuals or units in the treatment group across the included studies.

An effect size (ES) is a standard metric that summarizes the degree to which a program or policy affects a measured outcome. If the effect size is positive, the outcome increases. If the effect size is negative, the outcome decreases.

Adjusted effect sizes are used to calculate the benefits from our benefit cost model. WSIPP may adjust effect sizes based on methodological characteristics of the study. For example, we may adjust effect sizes when a study has a weak research design or when the program developer is involved in the research. The magnitude of these adjustments varies depending on the topic area.

WSIPP may also adjust the second ES measurement. Research shows the magnitude of some effect sizes decrease over time. For those effect sizes, we estimate outcome-based adjustments which we apply between the first time ES is estimated and the second time ES is estimated. We also report the unadjusted effect size to show the effect sizes before any adjustments have been made. More details about these adjustments can be found in our [Technical Documentation](#).

Helping the Noncompliant Child

Children's Mental Health: Disruptive Behavior

Benefit-cost estimates updated December 2017. Literature review updated June 2015.

Program Description: In this program, a therapist directly observes a parent and child through a one-way mirror, and provides direct coaching to the parent through a radio earphone. The program is delivered in two phases. The first phase focuses on "differential attention", when parents are taught to describe the child's appropriate behavior to the child rather than giving commands and to give rewards through positive physical attention and verbal praise. In the second phase, parents learn the importance of clear, simple instructions and to provide positive rewards for compliance and negative consequences for noncompliance.

Benefit-Cost Summary Statistics Per Participant

Benefits to:			
Taxpayers	\$574	Benefit to cost ratio	\$2.23
Participants	\$634	Benefits minus costs	\$857
Others	\$549	Chance the program will produce	
Indirect	(\$203)	benefits greater than the costs	65 %
<u>Total benefits</u>	<u>\$1,555</u>		
<u>Net program cost</u>	<u>(\$698)</u>		
Benefits minus cost	\$857		

The estimates shown are present value, life cycle benefits and costs. All dollars are expressed in the base year chosen for this analysis (2016). The chance the benefits exceed the costs are derived from a Monte Carlo risk analysis. The details on this, as well as the economic discount rates and other relevant parameters are described in our [Technical Documentation](#).

Detailed Monetary Benefit Estimates Per Participant

Benefits from changes to: ¹	Benefits to:				
	Participants	Taxpayers	Others ²	Indirect ³	Total
Crime	\$0	\$25	\$57	\$13	\$95

Detailed Annual Cost Estimates Per Participant

	Annual cost	Year dollars	Summary	
Program costs	\$1,612	2007	Present value of net program costs (in 2016 dollars)	(\$698)
Comparison costs	\$1,000	2007	Cost range (+ or -)	10 %

This program is very similar to Parent-Child Interaction Therapy (PCIT), requiring similar equipment and therapist qualifications. In 2007, the standard PCIT expenditures provided by Children's Administration (average reimbursement rate for families receiving PCIT in Washington) was \$2,240. Helping the Noncompliant Child requires ten sessions, compared to an average of 13.9 sessions in the studies we reviewed for PCIT, so we estimate the cost for HNC to be 10/13.9 multiplied by \$2,240.

The figures shown are estimates of the costs to implement programs in Washington. The comparison group costs reflect either no treatment or treatment as usual, depending on how effect sizes were calculated in the meta-analysis. The cost range reported above reflects potential variation or uncertainty in the cost estimate; more detail can be found in our [Technical Documentation](#).

Families and Schools Together (FAST)

Children's Mental Health: Disruptive Behavior

Benefit-cost estimates updated December 2017. Literature review updated April 2012.

Program Description: Families and Schools Together (FAST) is a multi-family after-school program. Originally developed to serve young school-age children at risk of school failure, the program is now also offered in schools with high rates of poverty and other risk factors. The goals of the program are to increase parent involvement in schools, strengthen the parent-child relationship, reduce stress by developing parent support groups, and prevent substance abuse by the child and family. Groups of 8 to 12 families meet for eight consecutive weeks for 2½ hours after school or early in the evenings. Teams of trained facilitators conduct meetings that involve experiential learning, parent-child play, and a shared meal.

Benefit-Cost Summary Statistics Per Participant

Benefits to:			
Taxpayers	\$764	Benefit to cost ratio	\$1.23
Participants	\$1,523	Benefits minus costs	\$439
Others	\$928	Chance the program will produce	
Indirect	(\$901)	benefits greater than the costs	50 %
Total benefits	\$2,315		
Net program cost	(\$1,876)		
Benefits minus cost	\$439		

The estimates shown are present value, life cycle benefits and costs. All dollars are expressed in the base year chosen for this analysis (2016). The chance the benefits exceed the costs are derived from a Monte Carlo risk analysis. The details on this, as well as the economic discount rates and other relevant parameters are described in our [Technical Documentation](#).

Detailed Annual Cost Estimates Per Participant

	Annual cost	Year dollars	Summary	
Program costs	\$1,694	2009	Present value of net program costs (in 2016 dollars)	(\$1,876)
Comparison costs	\$0	2009	Cost range (+ or -)	10 %

This program is typically provided in eight sessions over two months. Kratochwill (2009) provided costs for the program evaluated in Madison, WI. Implementation (actual presentation of the program) cost \$1,194 per child, plus an average cost of \$500 per child to train the program facilitators. Training costs assumes eight groups could be accommodated per training. See Kratochwill, T.R., McDonald, L., Levin, J.R., Scalia, P.A., & Coover, G. (2009). Families and Schools Together: An experimental study of multi-family support groups for children at risk. *Journal of School Psychology, 47*(4), 245-265.

The figures shown are estimates of the costs to implement programs in Washington. The comparison group costs reflect either no treatment or treatment as usual, depending on how effect sizes were calculated in the meta-analysis. The cost range reported above reflects potential variation or uncertainty in the cost estimate; more detail can be found in our [Technical Documentation](#).

Detailed Annual Cost Estimates Per Participant

Brief Strategic Family Therapy (BSFT)

Children's Mental Health: Disruptive Behavior

Benefit-cost estimates updated December 2017. Literature review updated June 2016.

Program Description: This intervention is aimed at children and adolescents who are at risk of developing serious behavior problems, including delinquency and substance abuse. Therapy targets maladaptive interactions and problems within each family. The program is typically 12 to 16 sessions of 60 to 90 minutes in length over a three- to four-month period. Because such risk can be defined in various ways, the studies in this analysis included participants with different types and severity of problems. This treatment has been extensively tested on ethnic minorities. More information is available at the program website. <http://brief-strategic-family-therapy.com/>

Benefit-Cost Summary Statistics Per Participant

Benefits to:			
Taxpayers	\$489	Benefit to cost ratio	\$0.65
Participants	(\$285)	Benefits minus costs	(\$192)
Others	\$177	Chance the program will produce	
Indirect	(\$29)	benefits greater than the costs	43 %
Total benefits	\$353		
Net program cost	(\$545)		
Benefits minus cost	(\$192)		

The estimates shown are present value, life cycle benefits and costs. All dollars are expressed in the base year chosen for this analysis (2016). The chance the benefits exceed the costs are derived from a Monte Carlo risk analysis. The details on this, as well as the economic discount rates and other relevant parameters are described in our [Technical Documentation](#).

Labor market earnings associated with illicit drug abuse or dependence	\$2	\$1	\$0	\$0	\$3
Health care associated with disruptive behavior disorder	\$188	\$578	\$716	\$290	\$1,773
Costs of higher education	(\$470)	(\$312)	(\$141)	(\$157)	(\$1,080)
Adjustment for deadweight cost of program	\$0	\$0	\$0	(\$273)	(\$273)
Totals	(\$285)	\$489	\$177	(\$29)	\$353

¹In addition to the outcomes measured in the meta-analysis table, WSIPP measures benefits and costs estimated from other outcomes associated with those reported in the evaluation literature. For example, empirical research demonstrates that high school graduation leads to reduced crime. These associated measures provide a more complete picture of the detailed costs and benefits of the program.

²"Others" includes benefits to people other than taxpayers and participants. Depending on the program, it could include reductions in crime victimization, the economic benefits from a more educated workforce, and the benefits from employer-paid health insurance.

³"Indirect benefits" includes estimates of the net changes in the value of a statistical life and net changes in the deadweight costs of taxation.

Detailed Annual Cost Estimates Per Participant

	Annual cost	Year dollars	Summary	
Program costs	\$1,350	2010	Present value of net program costs (in 2016 dollars)	(\$545)
Comparison costs	\$850	2010	Cost range (+ or -)	10 %

This intervention usually takes place over a three- to four-month period. We estimated per-participant cost based on an average of 14.8 hours of therapist time, as reported in the treatment studies, multiplied by actuarial estimate of cost of hourly family therapy reported in Mercer. (2013). *Behavioral Health Data Book for the State of Washington for Rates Effective January 1, 2014*. Comparison cost is based on the average DSHS reimbursement for treatment of child disruptive behavior.

The figures shown are estimates of the costs to implement programs in Washington. The comparison group costs reflect either no treatment or treatment as usual, depending on how effect sizes were calculated in the meta-analysis. The cost range reported above reflects potential variation or uncertainty in the cost estimate; more detail can be found in our [Technical Documentation](#).

Detailed Annual Cost Estimates Per Participant

The graph above illustrates the estimated cumulative net benefits per-participant for the first fifty years beyond the initial investment in the program. We present these cash flows in non-discounted dollars to simplify the “break-even” point from a budgeting perspective. If the dollars are negative (bars below \$0 line), the cumulative benefits do not outweigh the cost of the program up to that point in time. The program breaks even when the dollars reach \$0. At this point, the total benefits to participants, taxpayers, and others, are equal to the cost of the program. If the dollars are above \$0, the benefits of the program exceed the initial investment.

Meta-Analysis of Program Effects

Outcomes measured	No. of effect sizes	Treatment N	Adjusted effect sizes and standard errors used in the benefit-cost analysis						Unadjusted effect size (random effects model)	
			First time ES is estimated			Second time ES is estimated			ES	p-value
			ES	SE	Age	ES	SE	Age		
Disruptive behavior disorder symptoms	3	124	-0.251	0.148	14	-0.119	0.092	17	-0.500	0.002
Illicit drug use disorder	2	301	-0.087	0.103	13	0.000	0.187	16	-0.086	0.405
Smoking in high school	1	20	-1.203	0.344	17	-1.203	0.344	18	-1.203	0.001
STD risky behavior [^]	1	20	-0.573	0.323	17	n/a	n/a	n/a	-0.573	0.076
Youth binge drinking	1	20	0.344	0.319	17	0.344	0.319	17	0.344	0.280

[^]WSIPP's benefit-cost model does not monetize this outcome.

Meta-analysis is a statistical method to combine the results from separate studies on a program, policy, or topic in order to estimate its effect on an outcome. WSIPP systematically evaluates all credible evaluations we can locate on each topic. The outcomes measured are the types of program impacts that were measured in the research literature (for example, crime or educational attainment). Treatment N represents the total number of individuals or units in the treatment group across the included studies.

An effect size (ES) is a standard metric that summarizes the degree to which a program or policy affects a measured outcome. If the effect size is positive, the outcome increases. If the effect size is negative, the outcome decreases.

Adjusted effect sizes are used to calculate the benefits from our benefit cost model. WSIPP may adjust effect sizes based on methodological characteristics of the study. For example, we may adjust effect sizes when a study has a weak research design or when the program developer is involved in the research. The magnitude of these adjustments varies depending on the topic area.

WSIPP may also adjust the second ES measurement. Research shows the magnitude of some effect sizes decrease over time. For those effect sizes, we estimate outcome-based adjustments which we apply between the first time ES is estimated and the second time ES is estimated. We also report the unadjusted effect size to show the effect sizes before any adjustments have been made. More details about these adjustments can be found in our [Technical Documentation](#).

Incredible Years: Parent training and child training

Children's Mental Health: Disruptive Behavior

Benefit-cost estimates updated December 2017. Literature review updated April 2012.

Program Description: Incredible Years Parent Training (www.incredibleyears.com) is a group, skills-based behavioral intervention for parents of children with behavior problems. The curriculum focuses on strengthening parenting skills (monitoring, positive discipline, confidence) and fostering parents' involvement in children's school experiences in order to promote children's academic, social, and emotional competencies and reduce conduct problems. Training classes include child care, a family meal, and transportation. Studies in this category included a child skills training component as well as parent training. Children with behavioral problems are taught social, emotional and academic skills, such as understanding and communicating feelings, using effective problem solving strategies, managing anger, practicing friendship and conversational skills, as well as appropriate classroom behaviors.

Benefit-Cost Summary Statistics Per Participant

Benefits to:			
Taxpayers	\$357	Benefit to cost ratio	\$0.18
Participants	\$388	Benefits minus costs	(\$1,413)
Others	\$335	Chance the program will produce	
Indirect	(\$763)	benefits greater than the costs	12 %
<u>Total benefits</u>	<u>\$316</u>		
<u>Net program cost</u>	<u>(\$1,729)</u>		
Benefits minus cost	(\$1,413)		

The estimates shown are present value, life cycle benefits and costs. All dollars are expressed in the base year chosen for this analysis (2016). The chance the benefits exceed the costs are derived from a Monte Carlo risk analysis. The details on this, as well as the economic discount rates and other relevant parameters are described in our [Technical Documentation](#).

Detailed Annual Cost Estimates Per Participant

	Annual cost	Year dollars	Summary	
Program costs	\$2,610	2013	Present value of net program costs (in 2016 dollars)	(\$1,729)
Comparison costs	\$881	2010	Cost range (+ or -)	10 %

Cost of parent training class per family provided by Washington State DSHS Children's Administration, 2012. WSIPP also added costs of practitioner training and curriculum for the parent classes and child classes, based on the findings of Foster et al., 2007 (training and curricula costs are low on a per-family basis, as curricula are shared between practitioners and distributed across many families who receive the intervention). Based on conversations with Lisa St. George from Incredible Years (June 2014), we assumed that a practitioner team might use their purchased training and curricula to serve 24 families per year on average, for about five years (120 families served per team). In addition, we estimated an implementation cost (per child) for the child training component, based on the staff time and cost reported in Foster et al. (2007), and assuming each practitioner serves 120 children over five years.

Foster, E.M., Olchowski, A.E., & Webster-Stratton, C.H. (2007). Is stacking intervention components cost-effective? An analysis of the Incredible Years program. *Journal of the American Academy of Child and Adolescent Psychiatry, 46*(11).

The figures shown are estimates of the costs to implement programs in Washington. The comparison group costs reflect either no treatment or treatment as usual, depending on how effect sizes were calculated in the meta-analysis. The cost range reported above reflects potential variation or uncertainty in the cost estimate; more detail can be found in our [Technical Documentation](#).

Stop Now and Plan (SNAP) Children's Mental Health: Disruptive Behavior

Benefit-cost estimates updated December 2017. Literature review updated December 2015.

Program Description: Stop Now and Plan (SNAP) is a program to reduce problem behavior and prevent criminal activity in children ages 6-11 with serious disruptive behavior problems. There are separate SNAP programs for girls and boys. SNAP includes a 12-week group program for children and parents. The group sessions are designed to teach children cognitive behavioral skills and give children structured time to practice to apply their skills in specific situations. In separate group sessions, parents learn parenting skills and strategies to cope with their own emotions. After the group sessions, SNAP provides additional services to meet individual family needs such as family counseling, school advocacy, or tutoring.

Benefit-Cost Summary Statistics Per Participant

Benefits to:			
Taxpayers	\$567	Benefit to cost ratio	\$0.05
Participants	\$414	Benefits minus costs	(\$3,177)
Others	\$483	Chance the program will produce	
Indirect	(\$1,305)	benefits greater than the costs	4 %
<u>Total benefits</u>	<u>\$160</u>		
<u>Net program cost</u>	<u>(\$3,337)</u>		
Benefits minus cost	(\$3,177)		

The estimates shown are present value, life cycle benefits and costs. All dollars are expressed in the base year chosen for this analysis (2016). The chance the benefits exceed the costs are derived from a Monte Carlo risk analysis. The details on this, as well as the economic discount rates and other relevant parameters are described in our [Technical Documentation](#).

Detailed Annual Cost Estimates Per Participant

	Annual cost	Year dollars	Summary	
Program costs	\$4,795	2012	Present value of net program costs (in 2016 dollars)	(\$3,337)
Comparison costs	\$1,567	2011	Cost range (+ or -)	20 %

SNAP is a 12-week program. We estimated the cost of the treatment group using cost estimates in Farrington and Koegl, 2014 and the licensing and training costs described in SNAP Schedule C licensing description (Leena Augimeri, personal communication, September 18, 2015). The cost of the control group was calculated based on the units of wraparound services received by participants in the comparison group in Burke & Loeber, 2014. As reported in Burke & Loeber, 2014, 13.1% of the comparison group received 7.9 units of wraparound services during the first three months, and 35% of the comparison group received wraparound services in the subsequent year. We estimated that the average per-participant units of wrap around services remained the same for the next year. To estimate per-unit cost of wrap around services we used the individual treatment reimbursement rate from Mercer, (2013). *Behavioral Health Data Book for the State of Washington for Rates Effective January 1, 2014*. All costs were converted from Canadian dollars to US dollars using the average exchange rate from the year the costs were measured. (<http://www.canadianforex.ca/forex-tools/historical-rate-tools/yearly-average-rates>).

Farrington, D.P., & Koegl, C.J. (2014). Monetary benefits and costs of the Stop Now And Plan Program for boys aged 6–11, based on the prevention of later offending. *Journal of Quantitative Criminology*, 31(2), 263-287. Burke, J.D., & Loeber, R. (2014). The effectiveness of the Stop Now And Plan (SNAP) Program for boys at risk for violence and delinquency. *Prevention Science*, 16(2), 242-253

The figures shown are estimates of the costs to implement programs in Washington. The comparison group costs reflect either no treatment or treatment as usual, depending on how effect sizes were calculated in the meta-analysis. The cost range reported above reflects potential variation or uncertainty in the cost estimate; more detail can be found in our [Technical Documentation](#).

Detailed Annual Cost Estimates Per Participant

The graph above illustrates the estimated cumulative net benefits per-participant for the first fifty years beyond the initial investment in the program. We present these cash flows in non-discounted dollars to simplify the “break-even” point from a budgeting perspective. If the dollars are negative (bars below \$0 line), the cumulative benefits do not outweigh the cost of the program up to that point in time. The program breaks even when the dollars reach \$0. At this point, the total benefits to participants, taxpayers, and others, are equal to the cost of the program. If the dollars are above \$0, the benefits of the program exceed the initial investment.

Meta-Analysis of Program Effects

Outcomes measured	No. of effect sizes	Treatment N	Adjusted effect sizes and standard errors used in the benefit-cost analysis						Unadjusted effect size (random effects model)	
			First time ES is estimated			Second time ES is estimated			ES	p-value
			ES	SE	Age	ES	SE	Age		
Externalizing behavior symptoms	2	150	-0.167	0.119	10	-0.079	0.070	13	-0.450	0.001
Internalizing symptoms	2	150	-0.118	0.119	10	-0.086	0.099	12	-0.318	0.008

Meta-analysis is a statistical method to combine the results from separate studies on a program, policy, or topic in order to estimate its effect on an outcome. WSIPP systematically evaluates all credible evaluations we can locate on each topic. The outcomes measured are the types of program impacts that were measured in the research literature (for example, crime or educational attainment). Treatment N represents the total number of individuals or units in the treatment group across the included studies.

An effect size (ES) is a standard metric that summarizes the degree to which a program or policy affects a measured outcome. If the effect size is positive, the outcome increases. If the effect size is negative, the outcome decreases.

Adjusted effect sizes are used to calculate the benefits from our benefit cost model. WSIPP may adjust effect sizes based on methodological characteristics of the study. For example, we may adjust effect sizes when a study has a weak research design or when the program developer is involved in the research. The magnitude of these adjustments varies depending on the topic area.

WSIPP may also adjust the second ES measurement. Research shows the magnitude of some effect sizes decrease over time. For those effect sizes, we estimate outcome-based adjustments which we apply between the first time ES is estimated and the second time ES is estimated. We also report the unadjusted effect size to show the effect sizes before any adjustments have been made. More details about these adjustments can be found in our [Technical Documentation](#).

Multisystemic Therapy (MST) for youth with serious emotional disturbance (SED)

Children's Mental Health: Serious Emotional Disturbance

Benefit-cost estimates updated December 2017. Literature review updated April 2012.

Program Description: Multisystemic Therapy (MST) is an intensive family-focused treatment, which combines aspects of cognitive, behavioral, and family therapies. Therapists work in the child's home, school, and community to modify his or her environment. Although MST is often conducted with juvenile offenders, the studies included here focused on children with externalizing problems who were not involved with the juvenile justice system at the time of intervention.

Benefit-Cost Summary Statistics Per Participant

Benefits to:			
Taxpayers	\$3,822	Benefit to cost ratio	\$1.38
Participants	\$4,293	Benefits minus costs	\$2,611
Others	\$3,708	Chance the program will produce	
Indirect	(\$2,305)	benefits greater than the costs	61 %
<u>Total benefits</u>	<u>\$9,517</u>		
<u>Net program cost</u>	<u>(\$6,906)</u>		
Benefits minus cost	\$2,611		

The estimates shown are present value, life cycle benefits and costs. All dollars are expressed in the base year chosen for this analysis (2016). The chance the benefits exceed the costs are derived from a Monte Carlo risk analysis. The details on this, as well as the economic discount rates and other relevant parameters are described in our [Technical Documentation](#).

Detailed Monetary Benefit Estimates Per Participant

Benefits from changes to: ¹	Benefits to:				
	Participants	Taxpayers	Others ²	Indirect ³	Total
Crime	\$0	\$661	\$1,787	\$328	\$2,776
Labor market earnings associated with high school graduation	\$3,426	\$1,556	\$1,579	\$0	\$6,561
Child abuse and neglect	\$1,032	\$0	\$0	\$0	\$1,032

Totals	\$4,293	\$3,822	\$3,708	(\$2,305)	\$9,517

¹In addition to the outcomes measured in the meta-analysis table, WSIPP measures benefits and costs estimated from other outcomes associated with those reported in the evaluation literature. For example, empirical research demonstrates that high school graduation leads to reduced crime. These associated measures provide a more complete picture of the detailed costs and benefits of the program.

²"Others" includes benefits to people other than taxpayers and participants. Depending on the program, it could include reductions in crime victimization, the economic benefits from a more educated workforce, and the benefits from employer-paid health insurance.

³"Indirect benefits" includes estimates of the net changes in the value of a statistical life and net changes in the deadweight costs of taxation.

Detailed Annual Cost Estimates Per Participant

	Annual cost	Year dollars	Summary	
Program costs	\$7,076	2008	Present value of net program costs (in 2016 dollars)	(\$6,906)
Comparison costs	\$850	2010	Cost range (+ or -)	10 %

MST-SED is typically provided for four to five months. Per-participant costs from Barnoski, R. (2009). *Providing evidence-based programs with fidelity in Washington state juvenile courts: Cost analysis*. Olympia: Washington State Institute for Public Policy, <http://www.wsipp.wa.gov/rptfiles/09-12-1201.pdf>.

The figures shown are estimates of the costs to implement programs in Washington. The comparison group costs reflect either no treatment or treatment as usual, depending on how effect sizes were calculated in the meta-analysis. The cost range reported above reflects potential variation or uncertainty in the cost estimate; more detail can be found in our [Technical Documentation](#).

Detailed Annual Cost Estimates Per Participant

The graph above illustrates the estimated cumulative net benefits per-participant for the first fifty years beyond the initial investment in the program. We present these cash flows in non-discounted dollars to simplify the “break-even” point from a budgeting perspective. If the dollars are negative (bars below \$0 line), the cumulative benefits do not outweigh the cost of the program up to that point in time. The program breaks even when the dollars reach \$0. At this point, the total benefits to participants, taxpayers, and others, are equal to the cost of the program. If the dollars are above \$0, the benefits of the program exceed the initial investment.

Meta-Analysis of Program Effects

Outcomes measured	No. of effect sizes	Treatment N	Adjusted effect sizes and standard errors used in the benefit-cost analysis						Unadjusted effect size (random effects model)

[^]WSIPP's benefit-cost model does not monetize this outcome.

Meta-analysis is a statistical method to combine the results from separate studies on a program, policy, or topic in order to estimate its effect on an outcome. WSIPP systematically evaluates all credible evaluations we can locate on each topic. The outcomes measured are the types of program impacts that were measured in the research literature (for example, crime or educational attainment). Treatment N represents the total number of individuals or units in the treatment group across the included studies.

An effect size (ES) is a standard metric that summarizes the degree to which a program or policy affects a measured outcome. If the effect size is positive, the outcome increases. If the effect size is negative, the outcome decreases.

Adjusted effect sizes are used to calculate the benefits from our benefit cost model. WSIPP may adjust effect sizes based on methodological characteristics of the study. For example, we may adjust effect sizes when a study has a weak research design or when the program developer is involved in the research. The magnitude of these adjustments varies depending on the topic area.

WSIPP may also adjust the second ES measurement. Research shows the magnitude of some effect sizes decrease over time. For those effect sizes, we estimate outcome-based adjustments which we apply between the first time ES is estimated and the second time ES is estimated. We also report the unadjusted effect size to show the effect sizes before any adjustments have been made. More details about these adjustments can be found in our [Technical Documentation](#).

Dialectical Behavior Therapy (DBT) for adolescent self-harming behavior

Children's Mental Health: Serious Emotional Disturbance

Benefit-cost estimates updated December 2017. Literature review updated August 2017.

Program Description: Dialectical Behavior Therapy (DBT) is a cognitive behavioral treatment originally developed for chronically parasuicidal adults. DBT involves both group skills training and individual psychotherapy and focuses on mindfulness, interpersonal, emotion-regulating, and self-management skills. In studies included in this meta-analysis, DBT was modified to treat adolescents by shortening the treatment length, streamlining and simplifying some lessons, and including parents in some sessions. Studies in this analysis include adolescents in both inpatient and outpatient treatment settings presenting with suicidal ideation, non-suicidal self-harm, and/or prior suicide attempts. Treatment duration ranges from 2-19 weeks, with multiple sessions per week.

Benefit-Cost Summary Statistics Per Participant

Benefits to:

Taxpayers	\$69	Benefit to cost ratio	\$0.97
Participants	\$27	Benefits minus costs	(\$5)
Others	\$13	Chance the program will produce	
Indirect	\$37	benefits greater than the costs	50 %
Total benefits	\$146		
Net program cost	(\$151)		
Benefits minus cost	(\$5)		

The estimates shown are present value, life cycle benefits and costs. All dollars are expressed in the base year chosen for this analysis (2016). The chance the benefits exceed the costs are derived from a Monte Carlo risk analysis. The details on this, as well as the economic discount rates and other relevant parameters are described in our [Technical Documentation](#).

Detailed Monetary Benefit Estimates Per Participant

Benefits from changes to:¹

Benefits to:

	Participants	Taxpayers	Others ²	Indirect ³	Total
K-12 grade repetition	\$0	\$0	\$0	\$0	\$0
Labor market earnings associated with major depression	\$27	\$12	\$0	\$85	\$123
Health care associated with psychiatric hospitalization	\$1	\$57	\$13	\$28	\$99
Costs of higher education	\$0	\$0	\$0	\$0	\$0
Adjustment for deadweight cost of program	\$0	\$0	\$0	(\$76)	(\$76)
Totals	\$27	\$69	\$13	\$37	\$146

¹In addition to the outcomes measured in the meta-analysis table, WSIPP measures benefits and costs estimated from other outcomes associated with those reported in the evaluation literature. For example, empirical research demonstrates that high school graduation leads to reduced crime. These associated measures provide a more complete picture of the detailed costs and benefits of the program.

²"Others" includes benefits to people other than taxpayers and participants. Depending on the program, it could include reductions in crime victimization, the economic benefits from a more educated workforce, and the benefits from employer-paid health insurance.

³"Indirect benefits" includes estimates of the net changes in the value of a statistical life and net changes in the deadweight costs of taxation.

Detailed Annual Cost Estimates Per Participant

	Annual cost	Year dollars	Summary	
Program costs	\$2,792	2016	Present value of net program costs (in 2016 dollars)	(\$151)
Comparison costs	\$2,641	2016	Cost range (+ or -)	25 %

Per-participant costs are based on a weighted average for therapist time of 15.97 hours in individual sessions and 18.17 hours of group sessions, as reported in the treatment studies, multiplied by the hourly therapist cost is based on the 2016 actuarial estimates of reimbursement for individual therapy (Mercer, 2015, Behavioral Health Data Book for the State of Washington for Rates Effective January 1, 2016). Comparison costs are calculated in the same way from study reports of control group treatments.

The figures shown are estimates of the costs to implement programs in Washington. The comparison group costs reflect either no treatment or treatment as usual, depending on how effect sizes were calculated in the meta-analysis. The cost range reported above reflects potential variation or uncertainty in the cost estimate; more detail can be found in our [Technical Documentation](#).

Detailed Annual Cost Estimates Per Participant

The graph above illustrates the estimated cumulative net benefits per-participant for the first fifty years beyond the initial investment in the program. We present these cash flows in non-discounted dollars to simplify the “break-even” point from a budgeting perspective. If the dollars are negative (bars below \$0 line), the cumulative benefits do not outweigh the cost of the program up to that point in time. The program breaks even when the dollars reach \$0. At this point, the total benefits to participants, taxpayers, and others, are equal to the cost of the program. If the dollars are above \$0, the benefits of the program exceed the initial investment.

Meta-Analysis of Program Effects

Outcomes measured	No. of effect sizes	Treatment N	Adjusted effect sizes and standard errors used in the benefit-cost analysis						Unadjusted effect size (random effects model)	
			First time ES is estimated			Second time ES is estimated			ES	p-value

Cognitive behavioral therapy (CBT)-based models for child trauma

Children's Mental Health: Trauma

Benefit-cost estimates updated December 2017. Literature review updated August 2017.

Program Description: Treatments include several components, such as psycho-education about post-traumatic stress disorder (PTSD), relaxation and other techniques for managing physiological and emotional stress, the gradual desensitization to memories of the traumatic event (also called exposure), and cognitive restructuring of inaccurate or unhelpful thoughts. In the studies included in this meta-analysis, treatment provided 5 to 27 therapeutic hours per client in individual or group settings, with duration of treatment ranging from one to five months. This review includes studies of Trauma-Focused CBT, Cognitive Behavioral Intervention for Trauma in Schools (CBITS), Narrative Exposure Therapy for traumatized children (Kid-NET), Enhancing Resiliency Among Students Experiencing Stress (ERASE), Trauma and Grief Component Therapy, and Teaching Recovery Techniques (TRT).

Benefit-Cost Summary Statistics Per Participant

Benefits to:			
Taxpayers	\$6,873	Benefit to cost ratio	n/a
Participants	\$11,345	Benefits minus costs	\$21,837
Others	\$2,452	Chance the program will produce	
Indirect	\$1,058	benefits greater than the costs	100 %
Total benefits	\$21,728		
Net program cost	\$109		
Benefits minus cost	\$21,837		

The estimates shown are present value, life cycle benefits and costs. All dollars are expressed in the base year chosen for this analysis (2016). The chance the benefits exceed the costs are derived from a Monte Carlo risk analysis. The details on this, as well as the economic discount rates and other relevant parameters are described in our [Technical Documentation](#).

Detailed Monetary Benefit Estimates Per Participant

Benefits from changes to: ¹	Benefits to:				
	Participants	Taxpayers	Others ²	Indirect ³	Total
Crime	\$0	\$12	\$31	\$6	\$49
K-12 grade repetition	\$0	\$9	\$0	\$5	\$14
K-12 special education	\$0	\$34	\$0	\$17	\$51
Labor market earnings associated with PTSD	\$10,734	\$4,875	\$0	\$0	\$15,608
Health care associated with PTSD	\$639	\$1,961	\$2,429	\$985	\$6,013
Costs of higher education	(\$27)	(\$18)	(\$8)	(\$9)	(\$62)
Adjustment for deadweight cost of program	\$0	\$0	\$0	\$55	\$55

¹In addition to the outcomes measured in the meta-analysis table, WSIPP measures benefits and costs estimated from other outcomes associated with those reported in the evaluation literature. For example, empirical research demonstrates that high school graduation leads to reduced crime. These associated measures provide a more complete picture of the detailed costs and benefits of the program.

²"Others" includes benefits to people other than taxpayers and participants. Depending on the program, it could include reductions in crime victimization, the economic benefits from a more educated workforce, and the benefits from employer-paid health insurance.

³"Indirect benefits" includes estimates of the net changes in the value of a statistical life and net changes in the deadweight costs of taxation.

Detailed Annual Cost Estimates Per Participant

	Annual cost	Year dollars	Summary	
Program costs	\$1,037	2016	Present value of net program costs (in 2016 dollars)	\$109
Comparison costs	\$1,035	2009	Cost range (+ or -)	30 %

Per-participant costs are based on weighted average therapist time, as reported in the included studies. Hourly therapist cost is based on the actuarial estimates of reimbursement by modality (Mercer, 2015, Behavioral Health Data Book for the State of Washington for Rates Effective January 1, 2016). Comparison cost is based on the average reimbursement for treatment of child post-traumatic stress disorder.

The figures shown are estimates of the costs to implement programs in Washington. The comparison group costs reflect either no treatment or treatment as usual, depending on how effect sizes were calculated in the meta-analysis. The cost range reported above reflects potential variation or uncertainty in the cost estimate; more detail can be found in our [Technical Documentation](#).

Eye Movement Desensitization and Reprocessing (EMDR) for child trauma

Children's Mental Health: Trauma

Benefit-cost estimates updated December 2017. Literature review updated April 2012.

Program Description: During this individual-based treatment, clients focus on a traumatic memory for 30 seconds at a time while the therapist provides a stimulus. For most clients, the therapist moves his hand slowly back and forth in front of the client (eye movement); for younger children, the therapist may, instead, tap the child's hand. The client reports on what thoughts come to mind and clients are guided to refocus on that thought in the next stimulus session. During therapy visits, clients report on the level of distress they feel. In later phases, a positive thought is emphasized during the stimulus sessions. Afterward, clients are asked to focus on residual physical tensions they may feel in order to enhance relaxation. The intervention is brief, typically one to two months of weekly or biweekly sessions. A more complete description of this therapy is available at: <http://www.emdrnetwork.org/description.html>.

Benefit-Cost Summary Statistics Per Participant

Benefits to:			
Taxpayers	\$2,721	Benefit to cost ratio	n/a
Participants	\$4,906	Benefits minus costs	\$8,810
Others	\$656	Chance the program will produce	
Indirect	\$362	benefits greater than the costs	82 %
<u>Total benefits</u>	<u>\$8,645</u>		
<u>Net program cost</u>	<u>\$165</u>		
Benefits minus cost	\$8,810		

The estimates shown are present value, life cycle benefits and costs. All dollars are expressed in the base year chosen for this analysis (2016). The chance the benefits exceed the costs are derived from a Monte Carlo risk analysis. The details on this, as well as the economic discount rates and other relevant parameters are described in our [Technical Documentation](#).

Detailed Monetary Benefit Estimates Per Participant

Benefits from changes to: ¹	Benefits to:				
	Participants	Taxpayers	Others ²	Indirect ³	Total
Crime	\$0	\$22	\$56	\$11	\$89
K-12 grade repetition	\$0	\$6	\$0	\$3	\$9
K-12 special education	\$0	\$53	\$0	\$26	\$79
Labor market earnings associated with anxiety disorder	\$4,768	\$2,165	\$0	\$0	\$6,933
Health care associated with PTSD	\$159	\$490	\$606	\$246	\$1,502
Costs of higher education	(\$22)	(\$14)	(\$7)	(\$7)	(\$50)
Adjustment for deadweight cost of program	\$0	\$0	\$0	\$83	\$83
Totals	\$4,906	\$2,721	\$656	\$362	\$8,645

¹In addition to the outcomes measured in the meta-analysis table, WSIPP measures benefits and costs estimated from other outcomes associated with those reported in the evaluation literature. For example, empirical research demonstrates that high school graduation leads to reduced crime. These associated measures provide a more complete picture of the detailed costs and benefits of the program.

²"Others" includes benefits to people other than taxpayers and participants. Depending on the program, it could include reductions in crime victimization, the economic benefits from a more educated workforce, and the benefits from employer-paid health insurance.

³"Indirect benefits" includes estimates of the net changes in the value of a statistical life and net changes in the deadweight costs of taxation.

Detailed Annual Cost Estimates Per Participant

	Annual cost	Year dollars	Summary	
Program costs	\$886	2009	Present value of net program costs (in 2016 dollars)	\$165
Comparison costs	\$1,035	2009	Cost range (+ or -)	10 %

This intervention typically takes place over one to two months. We estimated the per-participant cost by computing the average hours of therapy reported in the studies multiplied by the average Regional Support Network costs (for 2009) for individual therapy for child PTSD.

The figures shown are estimates of the costs to implement programs in Washington. The comparison group costs reflect either no treatment or treatment as usual, depending on how effect sizes were calculated in the meta-analysis. The cost range reported above reflects potential variation or uncertainty in the cost estimate; more detail can be found in our [Technical Documentation](#).

Detailed Annual Cost Estimates Per Participant

The graph above illustrates the estimated cumulative net benefits per-participant for the first fifty years beyond the initial investment in the program. We present these cash flows in non-discounted dollars to simplify the “break-even” point from a budgeting perspective. If the dollars are negative (bars below \$0 line), the cumulative benefits do not outweigh the cost of the program up to that point in time. The program breaks even when the dollars reach \$0. At this point, the total benefits to participants, taxpayers, and others, are equal to the cost of the program. If the dollars are above \$0, the benefits of the program exceed the initial investment.

Meta-Analysis of Program Effects

Outcomes measured	No. of effect sizes	Treatment N	Adjusted effect sizes and standard errors used in the benefit-cost analysis						Unadjusted effect size (random effects model)	
			First time ES is estimated			Second time ES is estimated			ES	p-value
			ES	SE	Age	ES	SE	Age		
Anxiety disorder	2	29	-0.226	0.269	11	-0.104	0.129	12	-0.184	0.521
Externalizing behavior symptoms	1	14	-0.512	0.378	11	-0.244	0.221	14	-0.512	0.175
Major depressive disorder	2	29	-0.228	0.269	11	0.000	0.029	12	-0.192	0.476
Post-traumatic stress	4	60	-0.356	0.277	11	-0.356	0.277	12	-0.510	0.134

Meta-analysis is a statistical method to combine the results from separate studies on a program, policy, or topic in order to estimate its effect on an outcome. WSIPP systematically evaluates all credible evaluations we can locate on each topic. The outcomes measured are the types of program impacts that were measured in the research literature (for example, crime or educational attainment). Treatment N represents the total number of individuals or units in the treatment group across the included studies.

An effect size (ES) is a standard metric that summarizes the degree to which a program or policy affects a measured outcome. If the effect size is positive, the outcome increases. If the effect size is negative, the outcome decreases.

Adjusted effect sizes are used to calculate the benefits from our benefit cost model. WSIPP may adjust effect sizes based on methodological characteristics of the study. For example, we may adjust effect sizes when a study has a weak research design or when the program developer is involved in the research. The magnitude of these adjustments varies depending on the topic area.

WSIPP may also adjust the second ES measurement. Research shows the magnitude of some effect sizes decrease over time. For those effect sizes, we estimate outcome-based adjustments which we apply between the first time ES is estimated and the second time ES is estimated. We also report the unadjusted effect size to show the effect sizes before any adjustments have been made. More details about these adjustments can be found in our [Technical Documentation](#).

New Beginnings for children of divorce

Children's Mental Health

Literature review updated June 2015.

Program Description: The New Beginnings program focuses on preventing adjustment problems for children whose parents have recently divorced. The single rigorous evaluation examines two variations of the program: a group intervention for mothers and a dual intervention program with groups for mothers and concurrent groups for children. In both variations of the program, the mothers' group focused on problem-solving, discipline strategies, mother-child relationship quality, and the mother's view of the child's relationship with the noncustodial father. In the dual intervention, the children's group focused on recognizing and labeling feelings, problem-solving, and positive re-framing.

Meta-Analysis of Program Effects

Outcomes measured	No. of effect sizes	Treatment N	Adjusted effect sizes and standard errors used in the benefit-cost analysis						Unadjusted effect size (random effects model)	
			First time ES is estimated			Second time ES is estimated			ES	p-value
			ES	SE	Age	ES	SE	Age		
Externalizing behavior symptoms	1	150	-0.135	0.163	17	-0.022	0.155	26	-0.240	0.141
Illicit drug use in high school	1	150	-0.036	0.593	17	-0.036	0.593	18	-0.064	0.767
Internalizing symptoms	1	150	0.084	0.163	17	-0.099	0.155	26	0.150	0.358
Problem alcohol use	1	164	0.076	0.155	26	0.076	0.155	27	0.136	0.378

Meta-analysis is a statistical method to combine the results from separate studies on a program, policy, or topic in order to estimate its effect on an outcome. WSIPP systematically evaluates all credible evaluations we can locate on each topic. The outcomes measured are the types of program impacts that were measured in the research literature (for example, crime or educational attainment). Treatment N represents the total number of individuals or units in the treatment group across the included studies.

An effect size (ES) is a standard metric that summarizes the degree to which a program or policy affects a measured outcome. If the effect size is positive, the outcome increases. If the effect size is negative, the outcome decreases.

Adjusted effect sizes are used to calculate the benefits from our benefit cost model. WSIPP may adjust effect sizes based on methodological characteristics of the study. For example, we may adjust effect sizes when a study has a weak research design or when the program developer is involved in the research. The magnitude of these adjustments varies depending on the topic area.

WSIPP may also adjust the second ES measurement. Research shows the magnitude of some effect sizes decrease over time. For those effect sizes, we estimate outcome-based adjustments which we apply between the first time ES is estimated and the second time ES is estimated. We also report the unadjusted effect size to show the effect sizes before any adjustments have been made. More details about these adjustments can be found in our [Technical Documentation](#).

Collaborative primary care for children with depression

Children's Mental Health: Depression

Literature review updated August 2017.

Program Description: Collaborative primary care integrates behavioral health into the primary care setting to treat children and adolescents with depression. In the collaborative care model, a care manager coordinates with a primary care provider and behavioral health care providers to develop and implement measurement-based treatment plans for individual patients. Care managers also provide psychoeducation and brief psychotherapy-based modules, such as cognitive behavioral therapy. The included study reports on Reaching Out to Adolescent in Distress (ROAD), a specific collaborative care model that was developed and implemented in Washington State. In the included studies, patients received collaborative care for 12 months. Patients in the comparison group received treatment as usual.

Meta-Analysis of Program Effects										
Outcomes measured	No. of effect sizes	Treatment N	Adjusted effect sizes and standard errors used in the benefit-cost analysis						Unadjusted effect size (random effects model)

Addition of CBT to antidepressants (compared to antidepressants alone) for adolescent depression

Children's Mental Health: Depression

Literature review updated August 2014.

Program Description: This collection of studies evaluated the effect of adding cognitive behavioral therapy (cognitive restructuring, engagement in pleasurable activities, emotion regulation, communication skills, and problem-solving) to treatment with antidepressants compared to treatment with antidepressants only.

Meta-Analysis of Program Effects										
Outcomes measured	No. of effect sizes	Treatment N	Adjusted effect sizes and standard errors used in the benefit-cost analysis						Unadjusted effect size (random effects model)

Choice Theory/Reality Therapy

Children's Mental Health: Disruptive Behavior

Literature review updated December 2015.

Program Description: Choice Theory/Reality Therapy is a program for parents of elementary students with repeated disciplinary referrals. The program is delivered in nine 90-minute group sessions. The program focuses on responding to child needs, teaching self-control by example, parenting in an authoritative (rather than authoritarian or permissive way) that sets limits in keeping with the child's development and creating a supportive environment in the home.

Meta-Analysis of Program Effects

Intensive Family Preservation Services (HOMEBUILDERS®) for youth with serious emotional disturbance (SED)

Children's Mental Health: Serious Emotional Disturbance

Literature review updated June 2016.

Program Description: Intensive Family Preservation Services are short-term, home-based crisis intervention services that emphasize placement prevention. The original program, HOMEBUILDERS®, was developed in 1974 in Federal Way, Washington. The program emphasizes contact with the family within 24 hours of the crisis, staff accessibility round the clock, small caseload sizes, service duration of four to six weeks, and provision of intensive, concrete services and counseling. This model is intended to prevent removal of a child from his or her biological home (or to promote his or her return to that home) by improving family functioning. For this analysis, we have presented the effects of all services together. In the single study included here, youth were at imminent risk of psychiatric hospitalization.

Meta-Analysis of Program Effects										
Outcomes measured	No. of effect sizes	Treatment N	Adjusted effect sizes and standard errors used in the benefit-cost analysis						Unadjusted effect size (random effects model)	
			First time ES is estimated			Second time ES is estimated			ES	p-value

Full fidelity wraparound for children with serious emotional disturbance (SED)

Children's Mental Health: Serious Emotional Disturbance

Literature review updated January 2012.

Program Description: Wraparound is an intensive, individualized care planning and management process for children with complex emotional and behavioral needs. During the wraparound process, a team of people who are relevant to the life of the child or youth collaboratively develop an individualized plan of care, implement this plan, monitor the efficacy of the plan, and work towards success over time. The wraparound plan typically includes formal services and interventions, together with community services and interpersonal support and assistance provided by friends, kin, and other people drawn from the family's social networks. After the initial plan is developed, the team continues to meet to monitor progress and revise interventions and strategies when needed.

Meta-Analysis of Program Effects

Child-Parent Psychotherapy

Children's Mental Health: Trauma

Literature review updated June 2013.

Program Description: This intervention is designed for parents (most frequently mothers) whose children have relationships to their parents that are characterized by less positive emotion and trust. In one of the two studies in the review, children had witnessed domestic violence. In the other, mothers had diagnoses of depression. The intervention consists of weekly psychotherapy sessions where both child and parent are present. The goal is to strengthen the relationship between parent and child, thereby increasing the child's sense of safety and attachment. The program is designed to consist of 50 weekly sessions.

Meta-Analysis of Program Effects

Outcomes measured	Primary or secondary participant	No. of effect sizes	Treatment N	Adjusted effect sizes and standard errors used in the benefit-cost analysis						Unadjusted effect size (random effects model)	
				First time ES is estimated			Second time ES is estimated			ES	p-value
				ES	SE	Age	ES	SE	Age		
Post-traumatic stress	Primary	1	36	-0.551	0.254	5	-0.551	0.254	6	-0.861	0.001
Test scores	Primary	1	43	0.282	0.206	5	0.087	0.227	17	0.282	0.170
Post-traumatic stress	Secondary	1	36	-0.309	0.251	28	-0.309	0.251	28	-0.483	0.056

Meta-analysis is a statistical method to combine the results from separate studies on a program, policy, or topic in order to estimate its effect on an outcome. WSIPP systematically evaluates all credible evaluations we can locate on each topic. The outcomes measured are the types of program impacts that were measured in the research literature (for example, crime or educational attainment). Treatment N represents the total number of individuals or units in the treatment group across the included studies.

An effect size (ES) is a standard metric that summarizes the degree to which a program or policy affects a measured outcome. If the effect size is positive, the outcome increases. If the effect size is negative, the outcome decreases.

Adjusted effect sizes are used to calculate the benefits from our benefit cost model. WSIPP may adjust effect sizes based on methodological characteristics of the study. For example, we may adjust effect sizes when a study has a weak research design or when the program developer is involved in the research. The magnitude of these adjustments varies depending on the topic area.

WSIPP may also adjust the second ES measurement. Research shows the magnitude of some effect sizes decrease over time. For those effect sizes, we estimate outcome-based adjustments which we apply between the first time ES is estimated and the second time ES is estimated. We also report the unadjusted effect size to show the effect sizes before any adjustments have been made. More details about these adjustments can be found in our [Technical Documentation](#).

Modularized Approaches to Treatment of Anxiety, Depression, and Behavior (MATCH)

Children's Mental Health: Other
Literature review updated June 2013.

Program Description: Modular treatment consists of modules from the three standard treatment types for child anxiety (Coping Cat), depression (Primary and Secondary Control Enhancement Training), and disruptive behavior (Behavioral Parent Training/Defiant Child), but therapists are free to introduce modules from more than one of the types. For example, during depression treatment, a therapist could use the module for defiant behavior if the child's behavior warranted and return to the depression treatment later.

Meta-Analysis of Program Effects										
Outcomes measured	No. of effect sizes	Treatment N	Adjusted effect sizes and standard errors used in the benefit-cost analysis						Unadjusted effect size (random effects model)	
			First time ES is estimated			Second time ES is estimated			ES	p-value
			ES	SE	Age	ES	SE	Age		
Externalizing behavior symptoms	1	62	-0.413	0.187	11	-0.197	0.128	13	-0.646	0.001
Internalizing symptoms	1	62	-0.350	0.187	11	-0.255	0.176	12	-0.546	0.004

Motivational interviewing to engage children in mental health treatment

Children's Mental Health: Other

Literature review updated August 2017.

Program Description: Motivational interviewing is a method of communication intended to increase participants' motivation for change. In clinical practice, motivational interviewing can be used with the goal of increasing engagement in treatment.

This analysis includes studies that use motivational interviewing with the goal of improving treatment engagement in mental health services for children and adolescents. In the included studies, participants have been diagnosed with mood or anxiety disorders or have been identified as "at risk" of developing a disorder. Participants in the intervention group received motivational interviewing in addition to being offered psychotherapy (such as cognitive-behavioral therapy). In this collection of studies, the motivational interviews typically lasted about 50 minutes and were provided by clinicians at outpatient mental health centers. Participants in the comparison condition were offered psychotherapy without motivational interviewing.

Meta-Analysis of Program Effects

Outcomes measured	No. of effect sizes	Treatment N	Adjusted effect sizes and standard errors used in the benefit-cost analysis						Unadjusted effect size (random effects model)	
			First time ES is estimated			Second time ES is estimated			ES	p-value
			ES	SE	Age	ES	SE	Age		
Engagement/Retention	2	89	0.324	0.201	16	n/a	n/a	n/a	0.505	0.013
Major depressive disorder	1	39	0.007	0.304	16	0.000	0.025	17	0.011	0.970

Washington State Institute for Public Policy

The Washington State Legislature created the Washington State Institute for Public Policy in 1983. A Board of Directors—representing the legislature, the governor, and public universities—governs WSIPP and guides the development of all activities. WSIPP's mission is to carry out practical research, at legislative direction, on issues of importance to Washington State.
